NEW QUESTION # 19

Following Mulesoft's recommended API-led connectivity approach, an organization has created an application network. The organization now needs to create API's to transform, orchestrate and aggregate the data provided by the other API's in the application network. This API should be flexible enough to handle the data from additional API's in future.

According to Mulesoft's recommended API-led connectivity approach, what is the best layer for this new API?

- A. System layer
- B. Experience layer
- C. Process layer
- D. Data layer

Answer: C

Explanation:

Correct answer is process layer as all the orchestration and transformation logic should be in process layer as per Mulesoft's recommended approach for API led connectivity.

API-led connectivity is a methodical way to connect data to applications through reusable and purposeful APIs. These APIs are developed to play a specific role - unlocking data from systems, composing data into processes, or delivering an experience.

What are the APIs that enable API-led connectivity?

API-led connectivity provides an approach for connecting and exposing assets. With this approach, rather than connecting things point-to-point, every asset becomes a managed API - a modern API, which makes it discoverable through self-service without losing control.

The APIs used in an API-led approach to connectivity fall into three categories:

System APIs - these usually access the core systems of record and provide a means of insulating the user from the complexity or any changes to the underlying systems. Once built, many users, can access data without any need to learn the underlying systems and can reuse these APIs in multiple projects.

Process APIs - These APIs interact with and shape data within a single system or across systems (breaking down data silos) and are created here without a dependence on the source systems from which that data originates, as well as the target channels through which that data is delivered.

Experience APIs - Experience APIs are the means by which data can be reconfigured so that it is most easily consumed by its intended audience, all from a common data source, rather than setting up separate point-to-point integrations for each channel. An Experience API is usually created with API-first design principles where the API is designed for the specific user experience in mind.

NEW QUESTION # 20

What is the object type returned by the File List operation?

- A. Object of String filenames
- B. Array of Mule event objects
- C. Object of Mule event objects
- D. Array of String file names

Answer: B

Explanation:

The List operation returns an array of messages in which: Each message holds the file's content in its payload.

The file's attributes section carries the file's metadata (such as name, creation time, and size). The payload is empty if the element is a folder.

NEW QUESTION # 21

What is output of Dataweave flatten function?

- A. Object
- B. LinkedHashMap
- C. Map
- D. Array

Answer: D

Explanation:

Correct answer is Array.

Flatten turns a set of subarrays (such as [[1,2,3], [4,5,6], [], [null]]) into a single, flattened array (such as [1, 2, 3, 4, 5, [6], null]).

This example defines three arrays of numbers, creates another array containing those three arrays, and then uses the flatten function to convert the array of arrays into a single array with all values.

Source

```
%dw 2.0
```

```
output application/json
```

```
var array1 = [1,2,3]
```

```
var array2 = [4,5,6]
```

```
var array3 = [7,8,9]
```

```
var arrayOfArrays = [array1, array2, array3]
```

```
---
```

```
flatten(arrayOfArrays)
```

Output

```
[ 1,2,3,4,5,6,7,8,9 ]
```
