Be certain about what you believe and consistent in what you say. If you intend to pass Amazon SAP-C02 exam, you must take prompt action. Which is the best for your reference on the website? If you don't know how to choose your reference materials, we commend our DumpsTests Amazon SAP-C02 Study Guide to you. DumpsTests Amazon SAP-C02 certification training materials is the most complete. There is another advantage: we can provide you with free update for a year.

The SAP-C02 certification exam is an important milestone for IT professionals who want to advance their careers in cloud computing. It demonstrates their expertise in designing and deploying complex applications on the AWS platform and validates their skills and knowledge to potential employers. By passing the SAP-C02 Exam, candidates can prove their proficiency in managing and deploying cloud-based solutions at an enterprise level.

SAP-C02 Latest Version, SAP-C02 Latest Exam Questions

The Amazon SAP-C02 desktop exam simulation software works only on Windows but the web-based SAP-C02 practice test is compatible with all operating systems and browsers. This is also an effective format for SAP-C02 Test Preparation. The SAP-C02 PDF dumps is an easily downloadable and printable file that carries the most probable Amazon SAP-C02 actual questions.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q600-Q605):

NEW QUESTION # 600

A company has an application that uses Amazon EC2 instances in an Auto Scaling group. The quality assurance (QA) department needs to launch a large number of short-lived environments to test the application.

The application environments are currently launched by the manager of the department using an AWS CloudFormation template. To launch the stack, the manager uses a role with permission to use CloudFormation EC2, and Auto Scaling APIs. The manager wants to allow testers to launch their own environments, but does not want to grant broad permissions to each user. Which set up would achieve these goals?

- A. Upload the AWS CloudFormation template to Amazon S3. Give users in the QA department permission to use CloudFormation and S3 APIs, with conditions that restrict the permissions to the template and the resources it creates. Train users to launch the template from the CloudFormation console.

- B. Create an AWS Elastic Beanstalk application from the environment template Give users in the QA department permission to use Elastic Beanstalk permissions only Train users to launch Elastic Beanstalk environments with the Elastic Beanstalk CLI, passing the existing role to the environment as a service role
- C. Create an AWS Service Catalog product from the environment template Add a launch constraint to the product with the existing role Give users in the QA department permission to use AWS Service Catalog APIs only_ Train users to launch the template from the AWS Service Catalog console.
- D. Upload the AWS CloudFormation template to Amazon S3. Give users in the QA department permission to assume the manager's role and add a policy that restricts the permissions to the template and the resources it creates Train users to launch the template from the CloudFormation console

Answer: C

NEW QUESTION # 601

A company is using AWS Organizations to manage multiple AWS accounts For security purposes, the company requires the creation of an Amazon Simple Notification Service (Amazon SNS) topic that enables integration with a third-party alerting system in all the Organizations member accounts A solutions architect used an AWS CloudFormation template to create the SNS topic and stack sets to automate the deployment of CloudFormation stacks Trusted access has been enabled in Organizations What should the solutions architect do to deploy the CloudFormation StackSets in all AWS accounts?

- A. Create stacks in the Organizations member accounts. Use self-service permissions. Set deployment options to deploy to an organization. Enable the CloudFormation StackSets automatic deployment.
- B. Create stacks in the Organizations management account. Use service-managed permissions. Set deployment options to deploy to the organization. Enable CloudFormation StackSets drift detection.
- C. Create a stack set in the Organizations management account Use service-managed permissions. Set deployment options to deploy to the organization. Enable CloudFormation StackSets automatic deployment.
- D. Create a stack set in the Organizations member accounts. Use service-managed permissions. Set deployment options to deploy to an organization. Use CloudFormation StackSets drift detection.

Answer: C

NEW QUESTION # 602

A company has a website that serves many visitors. The company deploys a backend service for the website in a primary AWS Region and a disaster recovery (DR) Region.

A single Amazon CloudFront distribution is deployed for the website. The company creates an Amazon Route 53 record set with health checks and a failover routing policy for the primary Region's backend service. The company configures the Route 53 record set as an origin for the CloudFront distribution. The company configures another record set that points to the backend service's endpoint in the DR Region as a secondary failover record type. The TTL for both record sets is 60 seconds.

Currently, failover takes more than 1 minute. A solutions architect must design a solution that will provide the fastest failover time. Which solution will achieve this goal?

- A. Create new record sets for the backend services by using a latency routing policy. Use the record sets as an origin in the CloudFront distribution.
- B. Deploy an additional CloudFront distribution. Create a new Route 53 failover record set with health checks for both CloudFront distributions.
- C. Create a CloudFront origin group that includes two origins, one for each backend service Region. Configure origin failover as a cache behavior for the CloudFront distribution.
- D. Set the TTL to 1 second for the existing Route 53 record sets that are used for the backend service in each Region.

Answer: C

NEW QUESTION # 603

A solutions architect is building a web application that uses an Amazon RDS for PostgreSQL DB instance. The DB instance is expected to receive many more reads than writes. The solutions architect needs to ensure that the large amount of read traffic can be accommodated and that the DB instance is highly available.

Which steps should the solutions architect take to meet these requirements? (Select THREE.)

- A. Configure an Amazon CloudWatch alarm to detect a failed read replica. Set the alarm to directly invoke an AWS Lambda function to delete its Route 53 record set.
- B. Create multiple read replicas and put them into an Auto Scaling group.
- C. Create an Amazon Route 53 hosted zone and a record set for each read replica with a TTL and a weighted routing policy.
- D. Create an Application Load Balancer (ALB) and put the read replicas behind the ALB.
- E. Create multiple read replicas in different Availability Zones.
- F. Configure an Amazon Route 53 health check for each read replica using its endpoint.

Answer: C,E,F

Explanation:

Explanation

<https://aws.amazon.com/premiumsupport/knowledge-center/requests-rds-read-replicas/> You can use Amazon Route 53 weighted record sets to distribute requests across your read replicas. Within a Route 53 hosted zone, create individual record sets for each DNS endpoint associated with your read replicas and give them the same weight. Then, direct requests to the endpoint of the record set. You can incorporate Route 53 health checks to be sure that Route 53 directs traffic away from unavailable read replicas.

NEW QUESTION # 604

A solutions architect is creating an AWS CloudFormation template from an existing manually created non-production AWS environment. The CloudFormation template can be destroyed and recreated as needed. The environment contains an Amazon EC2 instance. The EC2 instance has an instance profile that the EC2 instance uses to assume a role in a parent account.

The solutions architect recreates the role in a CloudFormation template and uses the same role name. When the CloudFormation template is launched in the child account, the EC2 instance can no longer assume the role in the parent account because of insufficient permissions. What should the solutions architect do to resolve this issue?

- A. Update the CloudFormation stack again. Specify only the CAPABILITY_NAMED_IAM capability.
- B. Update the CloudFormation stack again. Specify the CAPABILITY_IAM capability and the CAPABILITY_NAMED_IAM capability.
- C. In the parent account, edit the trust policy for the role that the EC2 instance needs to assume. Add a statement that allows the sts:AssumeRole action for the root principal of the child account. Save the trust policy.
- D. In the parent account, edit the trust policy for the role that the EC2 instance needs to assume. Ensure that the target role ARN in the existing statement that allows the sts:AssumeRole action is correct. Save the trust policy.

Answer: C

NEW QUESTION # 605

.....

Just like the old saying goes: "Practice is the only standard to testify truth", which means learning of theory ultimately serves practical application, in the same way, it is a matter of common sense that pass rate of a kind of SAP-C02 exam torrent is the only standard to testify whether it is effective and useful. I believe that you already have a general idea about the advantages of our AWS Certified Solutions Architect - Professional (SAP-C02) exam question, but now I would like to show you the greatest strength of our SAP-C02 Guide Torrent --the highest pass rate. According to the statistics, the pass rate among our customers who prepared the exam under the guidance of our SAP-C02 guide torrent has reached as high as 98% to 100% with only practicing our SAP-C02 exam torrent for 20 to 30 hours.
