UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q40-Q45):

NEW QUESTION # 40

What is a characteristic of using Business Process Model and Notation by process excellence practitioners?

- A. It solely provides tools for designing aesthetic workflows, with no focus on controlled automation or dynamic process management.
- B. It lacks constructs such as error and exception handling support, limiting its use for controlled automation design.
- C. It acts as an enabler for standards-based, model-driven collaboration between business groups and IT implementers.
- D. It is only used for modeling static workflows without support for dynamic or unpredictable process changes.

Answer: C

Explanation:

The correct answer is C - Business Process Model and Notation (BPMN) is a standards-based modeling language used by process excellence practitioners to visually define, communicate, and govern business workflows.

In UiPath's Maestro orchestration platform, BPMN acts as a collaborative bridge between:

- * Business stakeholders (who define processes and goals)
- * Technical implementers (who build automations and agent logic)

BPMN includes rich constructs such as:

- * Gateways for conditional logic
- * Events for escalations and errors
- * Tasks, subprocesses, and human interventions

This makes it ideal for dynamic, agentic workflows - not just static process mapping.

A and B are false - BPMN is built for adaptive, automated, and collaborative orchestration.

D is wrong - BPMN supports error handling, retries, and fallback flows, all critical in agentic automation.

NEW QUESTION # 41

What are the characteristics of an agentic story within the 'Do later' quadrant in the impact and feasibility matrix?

- A. Low feasibility and Low Impact
- B. Low feasibility and High Impact
- C. High feasibility and High Impact
- D. High feasibility and Low Impact

Answer: D

Explanation:

C is correct - an agentic story that falls into the "Do Later" quadrant typically represents high feasibility but low impact.

In UiPath's Impact vs. Feasibility Matrix, used during the Agentic Discovery phase, automation ideas are evaluated on:

- * Feasibility (ease of implementation)
- * Impact (business value, time saved, ROI)

Quadrants:

- * Quick Wins: High impact, high feasibility
- * Do Later: Low impact, high feasibility
- * Strategic Bets: High impact, low feasibility
- * Avoid/Backlog: Low on both

'Do Later' agentic stories are often simple to automate but don't deliver meaningful outcomes - e.g., automating low-volume tasks or internal reports with limited audience.

Focusing on impactful use cases ensures agent development time translates to real business value - one of the key lessons from UiPath's agentic blueprint methodology.

NEW QUESTION # 42

How does adjusting the "Number of results" setting affect the agent's use of context from indexes?

- A. It selects which Orchestrator folder to use, determining the location of stored workflows and deciding which set of predefined rules will apply during data retrieval and processing.
- B. It changes the number of chunks returned, impacting both the size of the grounding payload and the filtering of relevant information.
- C. It modifies the similarity threshold for chunk retrieval and lowers the number of tokens used.
- D. It makes the agent ignore all context completely, resulting in outputs that are entirely disconnected from the indexed data, regardless of its relevance to the query or prompt provided.

Answer: B

Explanation:

The correct answer is C. In UiPath's Context Grounding configuration, the "Number of results" setting directly affects how many chunks of indexed knowledge are retrieved and passed to the LLM at runtime.

These chunks come from preprocessed documents and are used to build the grounding payload - the content added to the agent's prompt for context-aware generation.

By increasing the number of results:

- * The LLM has access to more context, which can improve response quality if the added information is relevant.
 - * However, it also increases the token load, which can reduce prompt space or introduce irrelevant noise if poorly tuned.
- Reducing the number of results leads to more focused prompts, with only top-ranked relevant chunks (based on cosine similarity) included. This is crucial when using large indexes or when LLM context windows are limited.

Option A confuses this setting with similarity threshold tuning, which is a separate parameter.

Option B is false - the agent does not ignore context unless context grounding is disabled.

Option D misrepresents the function - Orchestrator folder selection is unrelated to this retrieval setting.

In summary, the "Number of results" setting allows fine-tuning of how much supporting context is retrieved and passed to the model. It is a key control in optimizing performance, precision, and relevance of grounded agent responses.

NEW QUESTION # 43

Which similarity search function is leveraged when Context Grounding is used by UiPath Products like Agents?

- A. ReLu similarity search
- **B. Cosine similarity search**
- C. Softmax similarity search
- D. Sigmoid similarity search

Answer: B

NEW QUESTION # 44

Which of the following is an essential aspect of crafting a comprehensive agent story during the validation stage?

- A. Starting immediately with agent behavior prototyping using tools like the Agents designer canvas in Studio Web without assessing mapped automations or impacted systems.
- B. Generalizing automation opportunities across all processes and roles without tailoring solutions based on specific personas or organizational contexts.
- C. Brainstorming automation use cases without validating personas or critically evaluating existing processes, focusing purely on agent capabilities.
- **D. Understanding the daily pain points and inefficiencies of the selected role to identify tasks that consume unnecessary time and potential gains from agent intervention.**

Answer: D

Explanation:

The correct answer is B- UiPath's Agentic Blueprint Design process emphasizes the importance of grounding automation opportunities in real user context and operational pain points.

During the validation stage, developers and stakeholders assess:

- * Specific persona roles and responsibilities
- * Current pain points and time-consuming tasks
- * Impact potential of agent assistance

This ensures the agent story reflects value-driven automation, not just technical ambition. It also validates that the agent solves real bottleneck- such as handling repetitive approvals, prioritizing requests, or managing context-based escalations.

UiPath warns against the pitfalls outlined in A, C, and D:

- * A and D overlook persona-centricity, which is essential.
- * C skips the critical discovery and mapping phase that should come before prototyping.

By focusing on B, teams ensure their agent is purpose-built for the right users, delivering measurable outcomes aligned to business needs.
