VMware 2V0-13.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">IT Architectures, Technologies, Standards: This section of the exam measures the skills of IT Architects and covers the ability to distinguish business requirements from technical ones. It expects candidates to understand the differences between conceptual, logical, and physical designs while also differentiating requirements, assumptions, constraints, and risks. Core concepts of availability, manageability, performance, recoverability, and security (AMPRS) are tested. Learners also need to document risk mitigation strategies, design decisions, and create a validation strategy that ties requirements to practical implementation.

Topic 2	<ul style="list-style-type: none"> • Plan and Design the VMware Solution: This section measures the skills of Cloud Infrastructure Designers. It focuses on gathering and analyzing business requirements and then transforming them into conceptual, logical, and physical models of VMware Cloud Foundation. Candidates are expected to identify prerequisites and make design decisions across fleet topologies, networking, management domains, workload domains, automation, and operations. The section also includes designing for availability within and across zones, creating strategies for manageability such as lifecycle, scalability, and capacity, and ensuring performance and recoverability through BCDR strategies. Additional emphasis is given to designing secure environments, workload migration strategies, and creating consumption, automation, and monitoring strategies to support modern applications and governance.
Topic 3	<ul style="list-style-type: none"> • Install, Configure, Administrate the VMware Solution: This section of the exam is relevant to System Administrators. Although it has no directly testable objectives, it underlines the expectation that candidates are familiar with installation, configuration, and administration tasks that form the foundation for VMware Cloud Foundation solutions.
Topic 4	<ul style="list-style-type: none"> • VMware Products and Solutions: This section of the exam evaluates the knowledge of VMware Solution Specialists and focuses on VMware Cloud Foundation (VCF). Candidates must be able to identify and differentiate between various VCF architecture options in given scenarios. The emphasis is on understanding the key products and how they integrate into enterprise design choices.
Topic 5	<ul style="list-style-type: none"> • Troubleshoot and Optimize the VMware Solution: This section of the exam measures the skills of Operations Engineers. There are no explicitly testable objectives provided in this domain, but candidates are expected to understand troubleshooting and optimization principles to maintain the VMware environment effectively in real-world deployments.

NEW QUESTION # 98

Which type of design would include specific details about server hardware, port connections, or Fibre Channel zones?

- A. Conceptual
- B. Logical
- C. Physical
- D. Service

Answer: C

Explanation:

The VMware Cloud Foundation 9.0.1 Architecture Guide defines three levels of design abstraction - Conceptual, Logical, and Physical. The Physical Design translates logical components into tangible configuration and implementation details. VMware describes it as:

"The physical design includes the specific details for hardware models, network topologies, storage layouts, port configurations, VLAN IDs, and zoning of Fibre Channel fabrics." In contrast:

* The Conceptual Design defines what the solution must deliver (high-level goals and relationships).

* The Logical Design outlines component relationships and service flows without vendor-specific or configuration details.

Therefore, the Physical Design is where the architect defines server model types, port mappings, uplink configurations, vSAN disk group layouts, and Fibre Channel zones, all aligned to the validated VCF Bill of Materials (BOM).
