Test EC-COUNCIL 112-57 Prep & New 112-57 Exam Notes

Originating the 112-57 exam questions of our company from tenets of offering the most reliable backup for customers, and outstanding results have captured exam candidates' heart for their functions. Our practice materials can be subdivided into three versions. All those versions of usage has been well-accepted by them. There is not much disparity among these versions of 112-57 simulating practice, but they do helpful to beef up your capacity and speed up you review process to master more knowledge about the 112-57 exam, so the review process will be unencumbered.

EC-COUNCIL EC-Council Digital Forensics Essentials (DFE) Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which of the following commands can an investigator use to parse GPTs of both types of hard disks, including those formatted with either UEFI or MBR?

- A. Get-BootSector
- **B. Get-ForensicPartitionTable**
- C. Get-GPT
- D. Get-PartitionTable

Answer: B

Explanation:

In forensic examinations, investigators must correctly interpret a disk's partitioning scheme because it determines where volumes begin, where file systems reside, and how to validate acquisition completeness.

Modern systems may use GPT (commonly associated with UEFI) while legacy systems often use MBR. A practical forensic command therefore needs to detect and parse partition information regardless of whether the disk uses MBR or GPT, and present

the results in a consistent, investigator-friendly output for verification and downstream analysis (e.g., selecting the correct partition offsets for imaging or mounting).

Get-ForensicPartitionTable is designed for exactly this role in forensic PowerShell tooling: it parses partition table structures in a forensically oriented manner and supports disks partitioned using either MBR or GPT.

That "forensic" emphasis typically means it reads raw structures directly, reports partition entries and offsets, and helps avoid ambiguity when the protective MBR (present on GPT disks) could confuse simplistic parsers.

By contrast, Get-BootSector targets boot sector/VBR data rather than the full partition layout; Get-GPT is GPT-specific and does not cover MBR-only disks; and Get-PartitionTable is a more generic label that may not guarantee dual-scheme forensic parsing. Therefore, the correct option is C.

NEW QUESTION # 55

James, a forensic specialist, was appointed to investigate an incident in an organization. As part of the investigation, James is attempting to identify whether any external storage devices are connected to the internal systems. For this purpose, he employed a utility to capture the list of all devices connected to the local machine and removed suspicious devices.

Identify the tool employed by James in the above scenario.

- A. DriveLetterView
- B. ESEDatabaseView
- C. PromiscDetect
- D. ProcDump

Answer: A

NEW QUESTION # 56

David, a cybercriminal, targeted a community and initiated anti-social campaigns online. In this process, he used a layer of the web that allowed him to maintain anonymity during the campaign.

Which of the following layers of the web allowed David to hide his presence during the anti-social campaign?

- A. Dark Web
- B. Surface Web
- C. World Wide Web
- D. Deep Web

Answer: A

Explanation:

The layer of the web most associated with maintaining anonymity for users and services is the Dark Web. In digital forensics terminology, the Dark Web refers to services hosted on overlay networks (such as Tor hidden services) that are not indexed by standard search engines and are typically accessible only through specialized software and configurations. Its core characteristic is that it is deliberately designed to reduce traceability by routing traffic through multiple relays and separating identifying information (like the user's real IP address) from the destination. This makes attribution and geolocation significantly harder using traditional network logs alone, which is why adversaries often choose it to conduct covert communications, host content, or coordinate campaigns.

By contrast, the Surface Web (the regular, indexed portion of the web) is generally reachable through normal browsers and is easier to monitor and attribute using conventional ISP, server, and platform logs. "World Wide Web" is a general term for web content accessed via HTTP/HTTPS and does not specifically imply anonymity. The Deep Web refers to content not indexed by search engines (e.g., webmail, databases, authenticated portals), but it is not inherently anonymizing—many deep web resources are simply private or access-controlled. Therefore, the layer enabling David to hide his presence is the Dark Web (C).

NEW QUESTION # 57

Which of the following files belonging to the Extensible Storage Engine (ESE) stores the mail data in Microsoft Exchange Server?

- A. WLCalendarStore.edb
- B. DataStore.edb
- C. Mail.MSMessageStore
- D. Database.edb

Answer: D

Explanation:

Microsoft Exchange Server stores mailbox contents (emails, attachments, folders, and related messaging objects) inside an ESE (Extensible Storage Engine) database that uses the .edb file format. In Exchange terminology this is the Mailbox Database, and its primary persistent store is the database .edb file along with associated transaction logs that support write-ahead logging and recovery. From a forensic perspective, the

.edb file is the central artifact because it contains the structured mailbox data that investigators analyze for message content, metadata (timestamps, sender/recipient fields, message IDs), and folder structure.

Among the options, Database.edb best matches the Exchange ESE mailbox database file that stores mail data.

The other options are either generic or associated with different Microsoft messaging components: Mail.

MS Message Store relates to the Windows Mail/Modern Mail app storage model rather than Exchange Server's mailbox database,

and WLCalendarStore.edb is commonly tied to Windows Live/Windows Essentials calendar or communications storage, not

Exchange's server-side mailbox store. DataStore.edb is also used by other Windows services, but the recognized Exchange mailbox store is the .edb database file, making Database.edb (D) the correct answer.

NEW QUESTION # 58

Which of the following standards and criteria version of SWGDE mandates that any action with the potential to alter, damage, or destroy any aspect of original evidence must be performed by qualified persons in a forensically sound manner?

- A. Standards and Criteria 1.1
- B. Standards and Criteria 1.5
- C. Standards and Criteria 1.7
- D. Standards and Criteria 1.3

Answer: C

Explanation:

The statement in the question matches SWGDE Principle 1, Standards and Criteria 1.7, which explicitly requires that any action that could alter, damage, or destroy original digital evidence must be performed by qualified personnel in a forensically sound manner. In digital forensics doctrine, this requirement exists because digital evidence is highly fragile: routine interactions (booting a system, opening a file, connecting storage, running commands) can change timestamps, overwrite unallocated space, modify logs, or trigger encryption/key rotation. SWGDE's emphasis on "qualified persons" and "forensically sound manner" aligns with core evidentiary expectations: minimizing changes to original media, using controlled and repeatable methods (e.g., write-blocking, validated imaging, documented procedures), and ensuring actions are defensible under scrutiny.

Options 1.1, 1.3, and 1.5 relate to broader quality and procedural requirements (quality systems, SOP review, appropriate tools), but they do not contain the specific mandate about potentially altering original evidence.

The exact phrasing about alteration/damage/destruction and qualified handling is associated with Standards and Criteria 1.7, making B the correct choice.
