In order to meet the different needs of customers, we have created three versions of our COF-C03 guide questions. Of course, the content of the three versions is exactly the same, but the displays are the totally different, so you only need to consider which version of our COF-C03 study braindumps you prefer. Perhaps you can also consult our opinions if you don't know the difference of these three versions. Or you can free download the demos of the COF-C03 exam braindumps to check it out.

Snowflake COF-C03 Exam Syllabus Topics:

Section	Objectives
Security and Access Control	- Role-based access control (RBAC) - Authentication and user management
Data Sharing and Protection	- Secure data sharing - Data replication and failover concepts
Performance and Optimization	- Warehouse sizing and scaling - Query optimization basics
Snowflake Architecture and Platform Concepts	- Snowflake architecture fundamentals - Virtual warehouses and compute model - Storage and data organization
Data Transformation and Processing	- SQL operations in Snowflake - Streams and tasks for data pipelines
Data Loading and Unloading	- External and internal stages - Bulk data loading using stages and COPY INTO

Snowflake SnowPro® Core Certification 2026 Exam (COF-C03) Sample

Questions (Q447-Q452):

NEW QUESTION # 447

Why would a Snowflake user decide to use a materialized view instead of a regular view?

- A. The query is not resource intensive.
- **B. The base tables do not change frequently.**
- C. The results of the view change often.
- D. The query results are not used frequently.

Answer: B

Explanation:

A Snowflake user would decide to use a materialized view instead of a regular view primarily when the base tables do not change frequently. Materialized views store the result of the view query and update it as the underlying data changes, making them ideal for situations where the data is relatively static and query performance is critical. By precomputing and storing the query results, materialized views can significantly reduce query execution times for complex aggregations, joins, and calculations.

NEW QUESTION # 448

What is a key difference between JSON and CSV file formats when loading data? Select TWO.

- A. CSV files automatically detect and apply data types during loading
- **B. CSV stores flat, tabular data**
- **C. JSON can be loaded into a VARIANT column without predefined schema**
- D. JSON must be converted to CSV before it can be queried
- E. CSV supports complex data types such as arrays and objects

Answer: B,C

Explanation:

The correct answers are A. CSV stores flat, tabular data and E. JSON can be loaded into a VARIANT column without predefined schema .

Important correction:

The provided answer A, B is not correct. CSV does not natively support complex semi-structured data types such as arrays and objects. JSON does.

Why A is correct:

CSV is a delimited, flat file format commonly used for structured, tabular data. Each row usually represents a record, and each field is separated by a delimiter such as a comma.

Why E is correct:

JSON is semi-structured data and can be loaded into a Snowflake VARIANT column. This allows Snowflake to store JSON objects and arrays without requiring every nested field to be predefined as a relational column.

Example:

```
CREATE TABLE json_data (  
  src VARIANT  
);  
COPY INTO json_data  
FROM @my_stage  
FILE_FORMAT = (TYPE = JSON);
```

Why the other options are incorrect:

B). CSV does not natively support arrays and objects. JSON supports nested structures such as arrays and objects.

C). JSON does not need to be converted to CSV before it can be queried in Snowflake. Snowflake can query JSON data stored in VARIANT, OBJECT, or ARRAY columns.

D). CSV files do not automatically detect and apply Snowflake table data types during loading. The target table schema and file format options control how data is interpreted.

Official Snowflake documentation reference:

Snowflake documentation explains that CSV is used for structured data, while semi-structured formats such as JSON can be loaded into VARIANT columns and queried using semi-structured data syntax.

NEW QUESTION # 449

Which table function will return the output of a previously-run command?

- A. QUERY_HISTORY
- B. FLATTEN
- C. RESULT_SCAN
- D. TASK_HISTORY

Answer: D

NEW QUESTION # 450

What does the TableScan operator represent in the Query Profile?

- A. The list of values provided with the VALUES clause
- B. The records generated using the TABLE (GENERATOR (...)) construct
- C. The access to data stored in stage objects
- D. The access to a single table

Answer: D

Explanation:

In the Query Profile of Snowflake, the TableScan operator represents the access to a single table. This operator indicates that the query execution involved reading data from a table stored in Snowflake. TableScan is a fundamental operation in query execution plans, showing how the database engine retrieves data directly from tables as part of processing a query.

NEW QUESTION # 451

Which object can be used to query the data loading history for the last 365 days for a Snowflake account?

- A. The database INFORMATION_SCHEMA.COPY_HISTORY table function
- B. The SNOWFLAKE.ACCOUNT_USAGE.DATA_TRANSFER_HISTORY view
- C. The SNOWFLAKE.ACCOUNT_USAGE.COPY_HISTORY view
- D. The database INFORMATION_SCHEMA.DATA_TRANSFER_HISTORY table function

Answer: C
