Salesforce Certified MuleSoft Developer II Sample Questions (Q57-Q62):

NEW QUESTION # 57

A Mule application includes a subflow containing a Scatter-Gather scope. Within each leg of the Scatter-Gather, an HTTP connector calls a PUT endpoint to modify records in different upstream system. The subflow is called inside an Unit successful scope to retry if a transitory exception is raised.

A technical spike is being performed to increase reliability of the Mule application.

Which steps should be performed within the Mule flow above to ensure idempotent behavior?

- A. Change the PUT requests inside the Scatter-Gather to POST requests
- **B. Ensure an error-handling flow performs corrective actions to roll back all changes if any leg of the Scatter-Gather fails**
- C. Remove the Put requests from the Scatter-Gather and perform them sequentially
- D. None, the flow already exhibits idempotent behavior

Answer: B

Explanation:

To ensure idempotent behavior within a Mule flow that contains a subflow with a Scatter-Gather scope, the developer should ensure an error-handling flow performs corrective actions to roll back all changes if any leg of the Scatter-Gather fails. Idempotency means that multiple identical requests have the same effect as a single request. Therefore, if one of the HTTP requests inside the Scatter-Gather fails, the error-handling flow should undo any changes made by other successful requests to ensure consistency and avoid partial updates. NEW QUESTION # 58

A Mule application deployed to a standalone Mule runtime uses VM queues to publish messages to be consumed asynchronously by another flow.

In the case of a system failure, what will happen to in-flight messages in the VM queues that have been consumed?

- A. For any type of queue, the message will be processed after the system comes online
- **B. For persistent queues, the message will be processed after the system comes online**
- C. For any type of queue, the message will be lost
- D. For transient queues, the message will be processed after the system comes online

Answer: B

Explanation:

In case of a system failure, in-flight messages in persistent VM queues that have been consumed will be processed after the system comes online. This is because persistent VM queues store messages on disk and guarantee delivery even if there is a system crash or restart. Therefore, any in-flight messages that have been consumed but not processed will be recovered from disk and processed when the system is back online. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/vm-connector#persistent-queues>

NEW QUESTION # 59

A healthcare customer wants to use hospital system data, which includes code that was developed using legacy tools and methods.

The customer has created reusable Java libraries in order to read the data from the system.

What is the most effective way to develop an API to retrieve the data from the hospital system?

- A. Refer to JAR files in the code
- B. Create the Java code in your project and reference the data from the code
- **C. Install libraries in a local repository and refer to it in the pom.xml file**
- D. Include the libraries when deploying the code into the runtime

Answer: C

Explanation:

To develop an API that retrieves data from a hospital system using reusable Java libraries, the developer should install libraries in a local repository and refer to it in the pom.xml file. This way, the developer can use Maven to manage dependencies and invoke Java code from Mule applications using Java Module operations. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#add-the-java-module-to-your-project> <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#invoke-java-code>

NEW QUESTION # 60

Refer to the exhibit.

What action must be performed to log all the errors raised by the VM Connector?

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <Configuration>
3
4   <Appenders>
5     <RollingFile name="file" >
13
14
15   <Loggers>
16
17
18 </Configuration>
```

- A. Add `<AsyncLogger name='orgroute.extensions.vml' level=ERROR!>` inside the Logger tag
- B. Nothing, as error-level events are automatically logged
- C. Configure `<Logger level='ERROR'/>` inside the VM Connector configuration
- D. Add `<AsyncLogger name='orgroute.extensions.vml' level=ERROR!>` inside the Appenders tag

Answer: D

Explanation:

To log all the errors raised by the VM Connector, the developer needs to add an async logger with the name 'org.mule.extension.vml' and the level 'ERROR' inside the appenders tag of the log4j2.xml file. This will enable logging all error-level events generated by the VM Connector to the console appender. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/logging-in-mule#configuring-custom-logging-settings>

NEW QUESTION # 61

A mule application exposes an API for creating payments. An Operations team wants to ensure that the Payment API is up and running at all times in production.

Which approach should be used to test that the payment API is working in production?

- A. Monitor the Payment API directly sending real customer payment data
- B. Configure the application to send health data to an external system
- C. Create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API
- D. Create a health check endpoint that reuses the same port number and HTTP Listener configuration as the API itself

Answer: C

Explanation:

To test that the payment API is working in production, the developer should create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API. This way, the developer can isolate the health check endpoint from the API traffic and avoid affecting the performance or availability of the API. The health check endpoint should return a simple response that indicates the status of the API, such as OK or ERROR.
