Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q60-Q65):

NEW QUESTION # 60

What is a Linux distribution?

- A. An operating system based on Linux but incompatible to the regular Linux kernel.
- B. The set of rules which governs the distribution of Linux kernel source code.
- C. The Linux file system as seen from the root account after mounting all file systems.
- D. A set of changes to Linux which enable Linux to run on another processor architecture.
- E. A bundling of the Linux kernel, system utilities and other software.

Answer: E

Explanation:

A Linux distribution is a collection of software that is based on the Linux kernel and can be installed on a computer or a device to create a functional operating system. A Linux distribution typically includes the Linux kernel, a set of system utilities and libraries, a graphical user interface (GUI), a package manager, and various applications and services. A Linux distribution may also include additional software or features that are specific to the distribution's goals, target audience, or philosophy. For example, some Linux distributions are designed for desktop users, while others are optimized for servers, embedded systems, or security. Some Linux distributions are based on other Linux distributions, while others are developed independently. Some Linux distributions are free and open source, while others are proprietary or commercial. Some Linux distributions are popular and widely used, while others are niche or experimental. Some examples of Linux distributions are Ubuntu, Fedora, Debian, Mint, Arch, and Red Hat. NEW QUESTION # 61

The current directory contains the following file:

```
-rw-r-r- 1 root exec 24551 Apr 2 12:36 test.sh
```

The file contains a valid shell script, but executing this file using `./test.sh` leads to this error:

```
bash: ./test.sh: Permission denied
```

What should be done in order to successfully execute the script?

- A. The file's extension should be changed from `.sh` to `.bin`.
- B. The SetUID bit should be set in the file's permissions
- C. The user executing the script should be added to the `exec` group.
- D. The script should be run using `#!/test.sh` instead of `./test.sh`.
- E. The execute bit should be set in the file's permissions.

Answer: E

Explanation:

The execute bit in Linux is a permission bit that allows the user to run an executable file or enter a directory. For regular files, such as scripts or binaries, the execute bit must be set for the user to run them. For directories, the execute bit allows the user to access the files and subdirectories inside. Therefore, to successfully execute the script `test.sh`, the execute bit should be set in the file's permissions. This can be done by using the `chmod` command with the `+x` option, for example: `chmod +x test.sh`. The other options are either irrelevant or incorrect. The file's extension does not affect its executability, only its association with a program. The user executing the script does not need to be in the `exec` group, as long as the user has the execute permission on the file. The SetUID bit is a special permission bit that allows the user to run the file as the file's owner, regardless of the user's identity. This is not necessary for executing the script, and may pose a security risk. The `#!/test.sh` syntax is invalid, as the `#!` is used to specify the interpreter for the script, not the script itself.
