It is known to us that the NSE7_CDS_AR-7.6 exam braindumps have dominated the leading position in the global market with the decades of painstaking efforts of our experts and professors. There are many special functions about study materials to help a lot of people to reduce the heavy burdens when they are preparing for the exams. For example, the NSE7_CDS_AR-7.6 study practice question from our company can help all customers to make full use of their sporadic time. Just like the old saying goes, time is our product by a good at using sporadic time person, will make achievements. If you can learn to make full use of your sporadic time to preparing for your NSE7_CDS_AR-7.6 Exam, you will find that it will be very easy for you to achieve your goal on the exam. Using our study materials, your sporadic time will not be wasted, on the contrary, you will spend your all sporadic time on preparing for your NSE7_CDS_AR-7.6 exam.

Fortinet NSE7_CDS_AR-7.6 Exam Overview:

Certification Vendor:	Fortinet
Exam Name:	Fortinet NSE 7 - Public Cloud Security 7.6.4 Architect
Exam Number:	NSE7_CDS_AR-7.6
Available Languages:	English
Related Certifications:	Fortinet Certified Solution Specialist - Cloud Security Fortinet NSE 7 Certification

Certificate Validity Period:	2 years
Passing Score:	Pass/Fail
Exam Format:	Multiple Choice, Scenario-based, Drag-and-Drop
Exam Duration:	75 minutes
Exam Price:	\$200 USD
Real Exam Qty:	35–40
Recommended Training:	Fortinet Public Cloud Security Training
Exam Registration:	Pearson VUE Registration
Sample Questions:	Fortinet NSE7_CDS_AR-7.6 Sample Questions
Exam Way:	Online proctored (OnVUE) or onsite at Pearson VUE test centers
Pre Condition:	Recommended: NSE 4 certification, hands-on experience with Fortinet products and public cloud platforms (AWS, Azure, Google Cloud)
Official Syllabus URL:	https://training.fortinet.com/local/staticpage/view.php?page=public_cloud_security_architect_exam

NSE7_CDS_AR-7.6 Exam Cram Pdf Pass Certify| Latest NSE7_CDS_AR-7.6 Online Training Materials: Fortinet NSE 7 - Public Cloud Security 7.6 Architect

We can say that how many the NSE7_CDS_AR-7.6 certifications you get and obtain qualification certificates, to some extent determines your future employment and development, as a result, the NSE7_CDS_AR-7.6 exam guide is committed to helping you become a competitive workforce, let you have no trouble back at home. Actually, just think of our NSE7_CDS_AR-7.6 Test Prep as the best way to pass the exam is myopic. They can not only achieve this, but ingeniously help you remember more content at the same time.

Fortinet NSE7_CDS_AR-7.6 Exam Syllabus Topics:

Topic	Details
Topic 1	• Troubleshooting: This domain involves resolving connectivity issues in AWS and Azure environments, including diagnosing problems with SDN connectors.
Topic 2	• Security Solutions Deployment: This domain covers deploying Fortinet solutions to protect IaaS and CaaS environments, and integrating them with cloud native security tools.
Topic 3	• Automation Tools: This domain focuses on using infrastructure-as-code tools like Terraform, Ansible, Azure Bicep, and AWS CloudFormation to automate cloud infrastructure and Fortinet solution deployments.
Topic 4	• Cloud Infrastructure Monitoring: This domain addresses monitoring AWS and Azure networks using Fortinet monitoring tools designed for cloud workload visibility and management.

Fortinet NSE 7 - Public Cloud Security 7.6 Architect Sample Questions (Q70-Q75):

NEW QUESTION # 70

Refer to the exhibit.

An experienced AWS administrator is creating a new virtual public cloud (VPC) flow log with the settings shown in the exhibit. What is the purpose of this configuration?

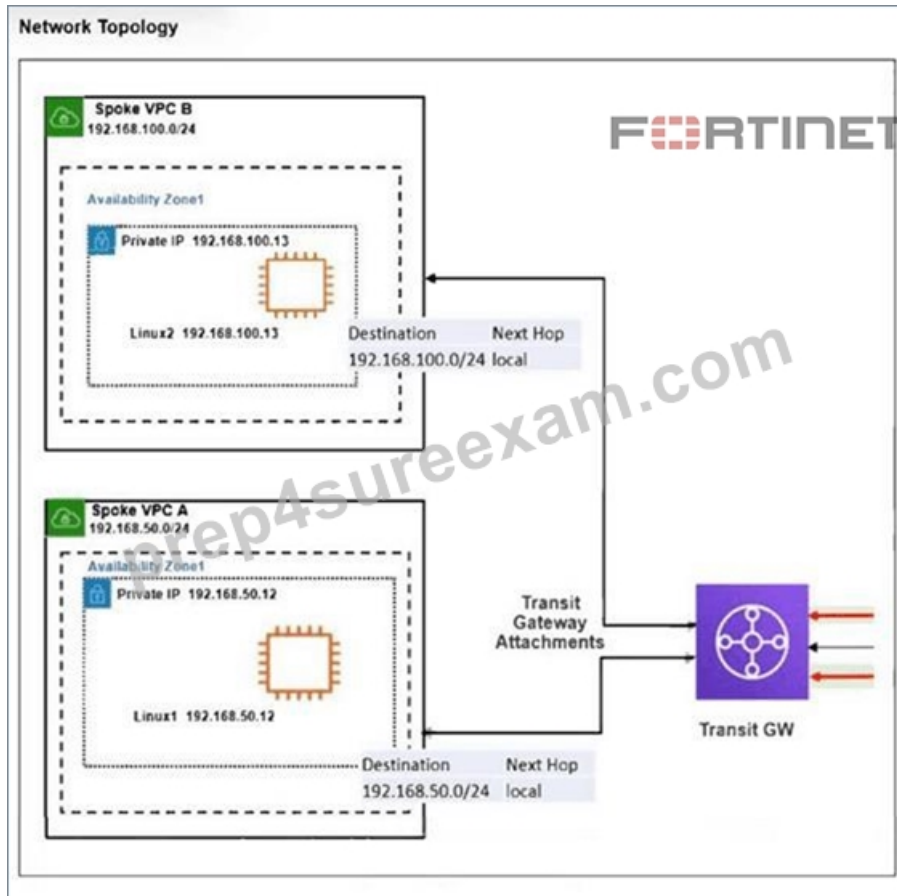

- A. To retain logs for a long term
- B. To troubleshoot a log flow issue
- C. To maximize the number of logs saved

- D. To monitor logs in real time

Answer: A

NEW QUESTION # 71

Refer to the exhibit.

The exhibit shows a customer deployment of two Linux instances and their main routing table in Amazon Web Services (AWS). The customer also created a Transit Gateway (TGW) and two attachments. Which two steps are required to route traffic from Linux instances to the TGW? (Choose two answers)

- A. In the main subnet routing table in VPC A and B, add a new route with destination 0.0.0.0/0, next hop TGW.12
- B. In the main subnet routing table in VPC A and B, add a new route with destination 0.0.0.0/0, next hop Internet gateway (IGW).
- C. In the TGW route table, associate two attachments.34
- D. In the TGW route table, add route propagation to 192.168.0.0/16.56

Answer: A,C

Explanation:

Comprehensive and Detailed Explanation From FortiOS 7.6, FortiWeb 7.4 Exact Extract study guide:

Based on the FortiOS 7.6 Cloud Security Study Guide regarding AWS Transit Gateway (TGW) integration and VPC routing, the following steps are mandatory to establish connectivity between Spoke VPCs via a TGW:

* VPC Route Table Configuration (Option A): For traffic to leave a VPC and reach the Transit Gateway, the VPC's subnet route table must have a specific entry. While the exhibit shows local routes for internal VPC traffic (192.168.50.0/24 and 192.168.100.0/24), any traffic destined for "outside" the local VPC (such as the other Spoke VPC) must be directed to the TGW. Adding a default route (0.0.0.0/0) with the TGW ID as the next hop ensures that all non-local traffic is forwarded to the Transit Gateway for processing.

* TGW Association (Option B): Within the Transit Gateway itself, connectivity is managed through Associations and Propagations. An "Association" links a specific VPC attachment to a TGW route table. Without associating the two attachments (for Spoke VPC A and Spoke VPC B) to a TGW route table, the TGW will not know which route table to use to make forwarding decisions for packets arriving from those VPCs.

* Why Option C is incorrect: Route propagation is used to automatically populate the TGW route table with the CIDR blocks of the

attached VPCs. While propagation is a valid step for dynamic routing, Option C specifically mentions propagating a static summary range (192.168.0.0/16) which is not the standard automated mechanism; usually, you propagate the specific VPC CIDRs. Furthermore, without the Association (Option B), propagation alone does not allow the TGW to process incoming traffic from the attachment.

* Why Option D is incorrect: Directing traffic to an Internet Gateway (IGW) would send the traffic to the public internet. This would not facilitate internal routing between the two Spoke VPCs via the Transit Gateway.

NEW QUESTION # 72

Refer to the exhibit.

A managed security service provider (MSSP) administration team is trying to deploy a new HA cluster in Azure to filter traffic to and from a client that is also using Azure. However, every deployment attempt fails, and only some of the resources are deployed successfully. While troubleshooting this issue, the team runs the command shown in the exhibit.

What are the implications of the output of the command?

- A. The team will not be able to deploy an active-active (A-P) FortiGate HA cluster with Azure load balancer.
- B. The team will not be able to deploy an A-P FortiGate HA cluster with Azure gateway load balancer.
- C. The team will not be able to deploy an A-P FortiGate HA cluster with Azure load balancer.
- D. The team will not be able to deploy an active-passive (A-P) FortiGate high availability (HA) cluster with SDN connector.

Answer: A

NEW QUESTION # 73

Which statement about immutable infrastructure in automation is true?

- A. It is the practice of applying hotfixes and OS patches after deployment.
- B. It is the practice of modifying the existing server configuration after it is deployed.
- C. It is the practice of deploying a new server for every configuration change.
- D. It is the practice of deploying two parallel servers for high availability.

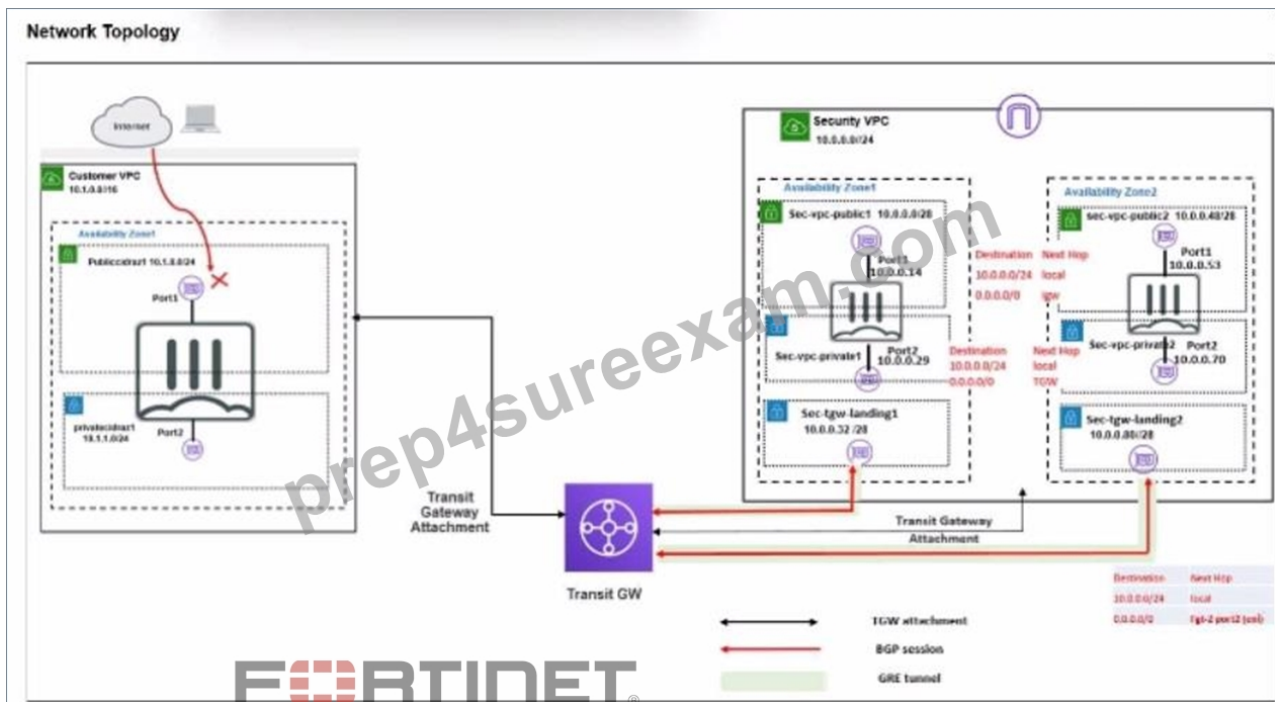

Answer: C

Explanation:

Immutable infrastructure means that servers are never modified after deployment. Instead, any configuration change or update is applied by deploying a new server instance with the desired configuration, ensuring consistency and reducing configuration drift.

NEW QUESTION # 74

Refer to the exhibit.

In your Amazon Web Services (AWS), you must allow inbound HTTPS access to the Customer VPC FortiGate VM from the internet. However, your HTTPS connection to the FortiGate VM in the Customer VPC is not successful. Also, you must ensure that the Customer VPC FortiGate VM sends all the outbound Internet traffic through the Security VPC. How do you correct this issue with minimal configuration changes? (Choose three.)

- A. Deploy an internet gateway, attach it to the Customer VPC, and then associate an EIP with the port1 of the FortiGate in the Customer VPC.
- B. Deploy an internet gateway, associate an EIP with the Customer VPC private subnet, and then add a new route with destination 0.0.0.0/0 with the internet gateway as the target.
- C. Add a route to the destination 0.0.0.0/0 with the transit gateway as the target.
- D. Add a route with your local internet public IP address as the destination and the internet gateway as the target.
- E. Add a route with your local internet public IP address as the destination and the transit gateway as the target.

Answer: A,C,E
