最新CTFL-AcT試験勉強資料、CTFL-AcTオンラインテストエンジン、CTFL-AcT無料サンプル

世界は変化している、我々はできるだけそのペースを維持する必要があります。我々JapancertはISQIのCTFL-AcT試験の変化を注目しています。数年以来の試験問題集を研究しています。現在あなたに提供するの大切なISQIのCTFL-AcT資料です。あなたの購入してから、我々はあなたにISQIのCTFL-AcT資料の更新状況をつと提

供します。このサービスは無料なのです。あなたが我々の資料を購入するとき、あなたのISQIのCTFL-AcT試験に関するすべてのヘルプを購入しました。

ISQI ISTQB Foundation Level - Acceptance Testing 認定 CTFL-AcT 試験問題 (Q41-Q46):

質問 # 41

Which tool fits the mentioned acceptance test activities BEST?

- **A. Business process management tools for modeling business processes and rules.**
- B. Model-based testing tools for managing incidents.
- C. Test management and automation tools for business process model-based acceptance test generation.
- D. Requirements management tools for managing acceptance test execution campaigns.

正解: A

解説:

Acceptance testing often relies on understanding and validating business processes and business rules. These are typically visualized and documented using business process modeling techniques such as BPMN (Business Process Model and Notation) and decision tables (DMN - Decision Model and Notation).

Business Process Management (BPM) tools are specifically designed for modeling and managing such workflows and rules. These tools are commonly used during acceptance test design to align tests with business objectives and processes.

Option C is correct because it directly aligns with the use of business process modeling in acceptance testing activities.

Other options:

A is incorrect because requirements management tools are more focused on requirement traceability and prioritization, not managing test execution campaigns.

B confuses roles - test management/automation tools can assist with test generation, but "business process model-based" generation is more accurately linked to BPM or model-based testing tools.

D is incorrect - model-based testing tools are used for test case generation, not incident management.

C). Business process management tools for modeling business processes and rules.

質問 # 42

During usability testing, the ergonomic of the products shall be checked. Which one of the following usability testing techniques matches this test objective BEST?

- A. Walkthrough
- B. Biometrics - based evaluation
- C. Log file analysis
- **D. Checklist-based evaluation**

正解: D

解説:

Usability testing aims to evaluate the ease of use, efficiency, and satisfaction with which users can achieve tasks. When checking the ergonomics (e.g., layout, visual clarity, interaction comfort), checklist-based evaluations are particularly useful.

Option A is correct because a checklist of ergonomic/usability heuristics (e.g., Nielsen's heuristics, ISO 9241 standards) allows evaluators to systematically assess whether the interface meets established usability criteria.

Other options:

B (Biometrics-based evaluation) tracks physiological responses (e.g., stress or eye movement), which are useful but indirect and less targeted to ergonomic checks.

C (Walkthroughs) help assess usability by observing task flows, but they are less focused on layout and ergonomic design.

D (Log file analysis) captures behavior but not directly ergonomic issues like spacing, font size, or element alignment.

A). Checklist-based evaluation

質問 # 43

Which one of the following sentences describes BEST a major advantage when business analysts and testers review the acceptance criteria together?

- A. A shared vision between the business analyst and the tester on acceptance criteria facilitates the design of acceptance test cases.
- B. The review of acceptance criteria is a good practice to improve the quality of test reports.
- C. The review of acceptance criteria helps to verify that acceptance test cases cover business processes, business rules and business risks.
- D. A joint review ensures that non-functional quality criteria are taken into account.

正解: A

解説:

Collaboration between business analysts and testers is essential in defining and reviewing acceptance criteria.

When both roles work together, they ensure the criteria are not only aligned with business goals but also testable and clearly specified.

Option A is correct because shared understanding of acceptance criteria allows testers to design test cases that truly validate business expectations, reducing misinterpretations and increasing confidence in the product.

Other options:

B is valid but not the best - non-functional requirements are important but often handled separately.

C is partially correct but assumes acceptance test cases already exist, whereas the review often happens earlier in the process.

D focuses on test reporting, which is downstream from criteria definition and test case design.

A). A shared vision between the business analyst and the tester on acceptance criteria facilitates the design of acceptance test cases.

質問 # 44

Which one of the following scenarios describes BEST a non-functional quality attribute that is relevant for accept testing?

- A. Modularity and reusability are best judged by those who operate the system later
- B. During acceptance testing, the operability of the product is checked in a realistic environment
- C. Time behavior is most relevant, as it cannot be tested prior to the acceptance testing level
- D. Testing basic functionality in acceptance testing verifies the correct usage of the product

正解: B

解説:

Non-functional quality attributes (also called quality characteristics) such as usability, reliability, operability, performance, and maintainability are often validated during acceptance testing to ensure the system behaves as expected under real-world conditions.

Option C is correct because operability - a subcharacteristic of usability per ISO 25010 - refers to the degree to which users can operate and control the system effectively. Acceptance testing often involves running the system in realistic settings to validate these aspects.

Other options:

A (Modularity and reusability) are more relevant to system architecture and design, not acceptance testing.

B is incorrect - time behavior (performance) can and should be tested at multiple levels, including system and integration testing before acceptance.

D is misleading - testing basic functionality is necessary, but it does not address non-functional quality attributes.

質問 # 45

Which one of the following statements describes the collaboration between business analysts and testers BEST?

- A. Testers participate in identifying business needs of stakeholders to better understand the business needs and related requirements.
- B. Business analysts usually cannot review acceptance tests, because they do not understand the technical details.
- C. Once the requirements and acceptance criteria have been defined, business analysts are no longer involved in testing activities.
- D. Business analysts collaborate on test planning and risk analysis to ensure that further on, appropriate test cases are developed and prioritized.

正解: D

解説:

The ISTQB CTFL Acceptance Testing Syllabus emphasizes the importance of collaboration between business analysts and testers throughout the testing lifecycle, especially during test planning and risk identification.

Business analysts contribute domain knowledge and business context, which is crucial in identifying business-critical areas, defining priorities, and ensuring that acceptance tests align with business goals.

Option A correctly identifies this collaboration. During test planning, business analysts help define acceptance criteria, identify risks from a business perspective, and support test prioritization to focus on high-value features. Their early involvement ensures that acceptance tests are meaningful and support stakeholder expectations.

Option B is incorrect as business analysts actively review acceptance tests to confirm alignment with business rules, regardless of technical complexity.

Option C is inaccurate because although testers seek to understand business needs, the responsibility for identifying those needs lies with business analysts.

Option D is incorrect; business analysts remain engaged throughout the project lifecycle, including test support and defect triage.

Exact Reference - ISTQB CTFL Acceptance Testing Syllabus (Section 1.4):

"Testers and business analysts collaborate during test planning and analysis activities to ensure the tests meet business needs and risk areas are adequately covered." Therefore, A provides the most accurate and comprehensive description.

質問 # 46
