CompTIA PenTest+ Exam Sample Questions (Q121-Q126):

NEW QUESTION # 121
A penetration tester is performing an assessment against a customer's web application that is hosted in a major cloud provider's environment. The penetration tester observes that the majority of the attacks attempted are being blocked by the organization's WAF. Which of the following attacks would be most likely to succeed?

- A. Brute-force
- B. Direct-to-origin
- C. DDoS
- D. Reflected XSS

Answer: B

Explanation:
When a web application firewall (WAF) is blocking most of the attacks, a direct-to-origin attack is likely to succeed. A direct-to-origin attack targets the backend servers directly, bypassing the WAF. This type of attack exploits any functionality that allows direct access to the origin servers (backend servers) without passing through the WAF. Techniques such as manipulating DNS, exploiting misconfigurations, or using direct IP access can be employed to bypass the WAF, making direct-to- origin attacks effective under these circumstances.

NEW QUESTION # 122
Which of the following explains the reason a tester would opt to use DREAD over PTES during the planning phase of a penetration test?

- A. The tester is assessing a mobile application.
- B. The tester is evaluating a thick client application.
- C. The tester is conducting a web application test.
- D. The tester is creating a threat model.

Answer: D

Explanation:
DREAD (Damage, Reproducibility, Exploitability, Affected Users, Discoverability) is a threat modeling framework used to assess and prioritize risks.
* Option A (Web application test) #: While DREAD can be used in web security, PTES (Penetration Testing Execution Standard) is a better framework for conducting pentests.
* Option B (Mobile application test) #: PTES provides guidelines for mobile security testing, whereas DREAD is for threat modeling.
* Option C (Thick client application) #: Thick clients require specific testing methodologies, not DREAD.
* Option D (Creating a threat model) #: Correct.
* DREAD is designed for risk assessment and prioritization.
* PTES focuses on penetration testing execution, not threat modeling.

NEW QUESTION # 123
During a security assessment, a penetration tester gains access to an internal server and manipulates some data to hide its presence.
Which of the following is the best way for the penetration tester to hide the activities performed?

- A. Reduce the log retention settings.
- B. Alter the log permissions.
- C. Modify the system time.
- D. Clear the Windows event logs.

Answer: D

Explanation:
During a penetration test, one of the critical steps for maintaining access and covering tracks is to clear evidence of the attack. Manipulating data to hide activities on an internal server involves ensuring that logs and traces of the attack are removed. Here's a detailed explanation of why clearing the Windows event logs is the best method for this scenario:
* Understanding Windows Event Logs: Windows event logs are a key forensic artifact that records system, security, and application events. These logs can provide detailed information about user activities, system changes, and potential security incidents.
* Why Clear Windows Event Logs:
* Comprehensive Coverage: Clearing the event logs removes all recorded events, including login attempts, application errors, and security alerts. This makes it difficult for an investigator to trace back the actions performed by the attacker.
* Avoiding Detection: Penetration testers clear event logs to ensure that their presence and activities are not detected by system administrators or security monitoring tools.
* Method to Clear Event Logs:
* Use the built-in Windows command line utility wevtutil to clear logs. For example:

```
shell
wevtutil cl System
wevtutil cl Security
wevtutil cl Application
```

* These commands clear the System, Security, and Application logs, respectively.
* Alternative Options and Their Drawbacks:
* Modify the System Time: Changing the system time can create confusion but is easily detectable and can be reverted. It does not erase existing log entries.
* Alter Log Permissions: Changing permissions might prevent new entries but does not remove existing ones and can alert administrators to suspicious activity.
* Reduce Log Retention Settings: This can limit future logs but does not affect already recorded logs and can be easily noticed by administrators.
* Case References:
* HTB Writeups: Many Hack The Box (HTB) writeups demonstrate the importance of clearing logs post-exploitation to maintain stealth. For example, in the "Gobox" and "Writeup" machines, maintaining a low profile involved managing log data to avoid detection.

* Real-World Scenarios: In real-world penetration tests, attackers often clear logs to avoid detection by forensic investigators and incident response teams. This step is crucial during red team engagements and advanced persistent threat (APT) simulations.
In conclusion, clearing Windows event logs is a well-established practice for hiding activities during a penetration test. It is the most effective way to remove evidence of the attack from the system, thereby maintaining stealth and ensuring that the tester's actions remain undetected.

NEW QUESTION # 124
A penetration tester breaks into a company's office building and discovers the company does not have a shredding service. Which of the following attacks should the penetration tester try next?

- A. Dumpster diving
- B. Phishing
- C. Tailgating
- D. Shoulder surfing

Answer: A

Explanation:
The penetration tester should try dumpster diving next, which is an attack that involves searching through trash bins or dumpsters for discarded documents or items that may contain sensitive or useful information.
Dumpster diving can reveal information such as passwords, account numbers, credit card numbers, invoices, receipts, memos, contracts, or employee records. The penetration tester can use this information to gain access to systems or networks, impersonate users or employees, or perform social engineering attacks. The other options are not likely attacks that the penetration tester should try next based on the discovery that the company does not have a shredding service. Phishing is an attack that involves sending fraudulent emails that appear to be from legitimate sources to trick users into revealing their credentials or clicking on malicious links or attachments. Shoulder surfing is an attack that involves observing or spying on users while they enter their credentials or perform other tasks on their devices. Tailgating is an attack that involves following authorized personnel into a restricted area without proper authorization or identification.

NEW QUESTION # 125
A penetration tester downloads a JAR file that is used in an organization's production environment. The tester evaluates the contents of the JAR file to identify potentially vulnerable components that can be targeted for exploit. Which of the following describes the tester's activities?

- A. SBOM
- B. ICS
- C. SAST
- D. SCA

Answer: D

Explanation:
The tester's activity involves analyzing the contents of a JAR file to identify potentially vulnerable components. This process is known as Software Composition Analysis (SCA).
Definition: SCA involves analyzing software to identify third-party and open-source components, checking for known vulnerabilities, and ensuring license compliance.
Purpose: To detect and manage risks associated with third-party software components.
