NEW QUESTION # 102

Huawei's anti-DDoS solution can be deployed in multiple scenarios. Which of the following are anti-DDoS deployment scenarios? (Select all that Apply)

- A. Flow inspection and dynamic traffic diversion
- B. Per-packet inspection and dynamic traffic diversion
- C. Off-path deployment and static traffic diversion
- D. In-line deployment

Answer: A,C,D

Explanation:

Huawei's anti-DDoS solution supports multiple deployment scenarios depending on the network design and customer needs:

A: Flow inspection and dynamic traffic diversion: Monitors traffic flows and dynamically redirects suspicious traffic to the cleaning center.

B: In-line deployment: Anti-DDoS device sits directly in the data path, filtering traffic in real time.

C: Off-path deployment and static traffic diversion: Traffic is redirected to scrubbing centers using fixed rules.

D: Per-packet inspection and dynamic traffic diversion is not a standard Huawei anti-DDoS deployment term, and Huawei's solution focuses on flow-level inspection, not deep per-packet analysis in this context.

NEW QUESTION # 103

Which of the following technologies implements inter-device link aggregation, and can be used to build an active-active system to provide traffic load balancing and backup protection?

- A. M-LAG
- B. Eth-Trunk
- C. Stack
- D. LLDP

Answer: A

Explanation:

M-LAG (Multi-Chassis Link Aggregation Group) is a technology that implements link aggregation across two or more independent physical devices (i.e., switches).

It enables downstream devices (such as servers or switches) to connect to two upstream devices as if they were one logical device. This allows for:

Active-active forwarding (traffic load balancing)

Device-level redundancy (if one upstream device fails, the other continues forwarding traffic) Eth-Trunk refers to link aggregation but generally within a single device.

Stack creates a logical switch from multiple physical switches, but it does not address inter-device aggregation in the same distributed manner as M-LAG.

LLDP (Link Layer Discovery Protocol) is a Layer 2 protocol for device discovery and has no role in link aggregation.
