## Data-Architect Passguide | New Data-Architect Test Price

If you are the first time to take part in the exam. We strongly advise you to buy our Data-Architect training materials. One of the most advantages is that our Data-Architect study braindumps are simulating the real exam environment. Many candidates usually feel nervous in the real exam. If you purchase our Data-Architect Guide questions, you do not need to worry about making mistakes when you take the real exam. In addition, you have plenty of time to practice on our Data-Architect exam prep.

## Salesforce Certified Data Architect Sample Questions (Q242-Q247):

### NEW QUESTION # 242

Universal Containers (CU) is in the process of implementing an enterprise data warehouse (EDW). UC needs to extract 100 million records from Salesforce for migration to the EDW.

What data extraction strategy should a data architect use for maximum performance?

- A. Use the Bulk API in parallel mode.
- B. Call the REST API in successive queries.
- C. Utilize PK Chunking with the Bulk API.
- D. Install a third-party AppExchange tool.

**Answer: C**

Explanation:

According to the Salesforce documentation<sup>2</sup>, extracting large amounts of data from Salesforce can be challenging and time-consuming, as it can encounter performance issues, API limits, timeouts, etc. To extract 100 million records from Salesforce for migration to an enterprise data warehouse (EDW), a data extraction strategy that can provide maximum performance is:

Utilize PK Chunking with the Bulk API (option C). This means using a feature that allows splitting a large query into smaller batches based on the record IDs (primary keys) of the queried object. This can improve performance and avoid timeouts by processing each batch asynchronously and in parallel using the Bulk API<sup>3</sup>.

Installing a third-party AppExchange tool (option A) is not a good solution, as it can incur additional costs and dependencies. It may also not be able to handle such a large volume of data efficiently. Calling the REST API in successive queries (option B) is also not a good solution, as it can encounter API limits and performance issues when querying such a large volume of data. Using the Bulk API in parallel mode (option D) is also not a good solution, as it can still cause timeouts and errors when querying such a large volume of data without chunking.

#### NEW QUESTION # 243

To address different compliance requirements, such as general data protection regulation (GDPR), personally identifiable information (PII), of health insurance Portability and Accountability Act (HIPAA) and others, a SF customer decided to categorize each data element in SF with the following:

Data owner

Security Level, such as confidential

Compliance types such as GDPR, PII, HIPAA

A compliance audit would require SF admins to generate reports to manage compliance.

What should a data architect recommend to address this requirement?

- A. Create a custom object and field to capture necessary compliance information and build custom reports.
- **B. Use field metadata attributes for compliance categorization, data owner, and data sensitivity level.**
- C. Build reports for field information, then export the information to classify and report for Audits.
- D. Use metadata API, to extract field attribute information and use the extract to classify and build reports

**Answer: B**

#### NEW QUESTION # 244

UC is building a salesforce application to track contacts and their respective conferences that they have attended with the following requirements:

1. Contacts will be stored in the standard contact object.
2. Conferences will be stored in a custom conference\_c object.
3. Each contact may attend multiple conferences and each conference may be related to multiple contacts.

How should a data architect model the relationship between the contact and conference objects?

- A. Create a master detail relationship field on the Conference object.
- **B. Implement a Contact Conference junction object with master detail relationship to both contact and conference\_c**
- C. Create a master detail relationship field on the Contact object.
- D. Create a lookup relationship field on contact object.

**Answer: B**

#### NEW QUESTION # 245

Get Cloudy Consulting is migrating their legacy system's users and data to Salesforce. They will be creating 15,000 users, 1.5 million Account records, and 15 million Invoice records. The visibility of these records is controlled by a 50 owner and criteria-based sharing rules.

Get Cloudy Consulting needs to minimize data loading time during this migration to a new organization.

Which two approaches will accomplish this goal? (Choose two.)

- **A. Defer sharing calculations until the data has finished uploading.**
- **B. Create the users, upload all data, and then deploy the sharing rules.**
- C. First, load all account records, and then load all user records.
- D. Contact Salesforce to activate indexing before uploading the data.

**Answer: A,B**

Explanation:

Creating the users, uploading all data, and then deploying the sharing rules will reduce the number of sharing recalculations that occur during the data load. Deferring sharing calculations until the data has finished uploading will also improve the performance by postponing the sharing rule evaluation. These are the recommended best practices for loading large data sets into Salesforce

#### **NEW QUESTION # 246**

Universal Containers has a requirement to store more than 100 million records in salesforce and needs to create a custom big object to support this business requirement.

Which two tools should a data architect use to build custom object?

- **A. Use Metadata API to create big object.**
- **B. Go to Big Object in setup select new to create big object.**
- C. Use DX to create big object.
- D. Go to Object Manager in setup and select new to create big object.

**Answer: A,B**

Explanation:

To build a custom big object to support storing more than 100 million records in Salesforce, a data architect should use Metadata API or Big Object in setup. Metadata API is an API that allows developers to create, retrieve, update, or delete metadata components in Salesforce programmatically. Big Object in setup is a user interface that allows admins to create big objects declaratively without writing code. Both tools can be used to define custom big objects and their fields, indexes, and relationships in Salesforce. Option A is incorrect because DX (Developer Experience) is a set of tools that allows developers to create and manage applications on Salesforce Platform, but it does not support creating big objects directly. Option D is incorrect because Object Manager in setup is a user interface that allows admins to create and manage standard and custom objects in Salesforce, but it does not support creating big objects declaratively.

#### **NEW QUESTION # 247**

.....

Some of our customers are white-collar workers with no time to waste, and need a Salesforce certification urgently to get their promotions, meanwhile the other customers might aim at improving their skills. Our reliable Data-Architect question dumps are developed by our experts who have rich experience in the fields. Constant updating of the Data-Architect Prep Guide keeps the high accuracy of exam questions thus will help you get use the Data-Architect exam quickly. During the exam, you would be familiar with the questions, which you have practiced in our Data-Architect question dumps. That's the reason why most of our customers always pass exam easily.
