Salesforce Certified MuleSoft Developer II Sample Questions (Q26-Q31):

NEW QUESTION # 26

Refer to the exhibit.

What is the result if "Insecure" selected as part of the HTTP Listener configuration?

□

- A. The HTTP Listener will trust any certificate presented by the HTTP client
- B. The HTTP listener will only accept HTTP requests
- C. Mutual TLS authentication will be enabled between this HTTP Listener and an HTTP client
- D. The HTTP Listener will accept any unauthenticated request

Answer: B

Explanation:

Based on the exhibit below, if 'Insecure' is selected as part of the HTTP Listener configuration, the HTTP listener will only accept

HTTP requests. This means that no TLS context will be configured for this listener and no encryption or authentication will be applied to incoming requests. The protocol attribute of this listener will be set to HTTP instead of HTTPS. Reference: <https://docs.mulesoft.com/http-connector/1.6/http-listener-ref/insecure>

NEW QUESTION # 27

A scatter-gather router is configured with four routes:Route A, B, C and D.
Route C false.

- A. Payload failures['2']
- B. Error,errorMessage,payload.failures['2']
- C. Error,errorMessage,payload.results ['2']
- D. Payload ['2']

Answer: C

Explanation:

The result of accessing route C failure is Error,errorMessage,payload.failures['2']. This is because a scatter-gather router returns an aggregated message that contains an array of results from each route and an array of failures from each route. The failures array contains error objects with information about each failed route execution. To access route C failure, which is the third route (index 2), the developer needs to use Error.errorMessage.payload.failures['2'] expression. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-reference#scatter-gather-output>

NEW QUESTION # 28

Which pattern should be used to invoke multiple HTTP APIs in parallel and roll back failed requests in sequence?

- A. A Parallel for Each scope with each HTTP request wrapped in a Try scope
- B. Scatter-Gather as central Saga orchestrator for all API request with compensating actions for failing routes
- C. VM queues as a reliability pattern with error handlers to roll back any requests
- D. A database as a transactional outbox and an Until Successful router to retry any requests

Answer: B

Explanation:

To invoke multiple HTTP APIs in parallel and roll back failed requests in sequence, the developer should use a Scatter-Gather router as a central Saga orchestrator for all API requests with compensating actions for failing routes. A Scatter-Gather router executes multiple routes concurrently and aggregates the results. A Saga orchestrator coordinates a series of actions across different services and handles failures by executing compensating actions. Therefore, using a Scatter-Gather router as a Saga orchestrator allows invoking multiple HTTP APIs in parallel and rolling back any failed requests in sequence. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-concept> <https://docs.mulesoft.com/mule-runtime/4.3/saga>

NEW QUESTION # 29

A mule application exposes an API for creating payments. An Operations team wants to ensure that the Payment API is up and running at all times in production.

Which approach should be used to test that the payment API is working in production?

- A. Create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API
- B. Create a health check endpoint that reuses the same port number and HTTP Listener configuration as the API itself
- C. Configure the application to send health data to an external system
- D. Monitor the Payment API directly sending real customer payment data

Answer: A

NEW QUESTION # 30

A Mule application need to invoice an API hosted by an external system to initiate a process. The external API takes anywhere between one minute and 24 hours to compute its process.

Which implementation should be used to get response data from the external API after it completes processing?

- A. Use an HTTP Connector inside Async scope to invoice the API and wait for a response
- B. Use an HTTP Connector to invoke the API and wait for a response
- C. Use a Scheduler to check for a response every minute
- D. **Expose an HTTP callback API in Mule and register it with the external system**

Answer: D

Explanation:

To get response data from the external API after it completes processing, the developer should expose an HTTP callback API in Mule and register it with the external system. This way, the external API can invoke the callback API with the response data when it is ready, instead of making the Mule application wait for a long time or poll for a response repeatedly. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/http-listener-ref#callback>
