In the 21 Century, the Professional-Cloud-Architect certification became more and more recognized in the society because it represented the certain ability of examinees. However, in order to obtain Professional-Cloud-Architect certification, you have to spend a lot of time preparing for the Professional-Cloud-Architect Exam. Many people gave up because of all kinds of difficulties before the examination, and finally lost the opportunity to enhance their self-worth. As a thriving multinational company, we are always committed to solving this problem.

Google Professional-Cloud-Architect exam is a certification for professionals who want to demonstrate their expertise in designing, developing, and managing solutions on the Google Cloud Platform. It is designed for individuals who have experience in cloud architecture and are looking to expand their skill set. Professional-Cloud-Architect exam tests candidates on their ability to design and manage solutions on GCP, as well as their understanding of cloud architecture principles.

The Google Certified Professional - Cloud Architect (GCP) certification exam tests the candidate's knowledge of GCP services, cloud solutions, and best practices for designing and managing cloud-based solutions. Professional-Cloud-Architect Exam is designed to assess the candidate's ability to architect and deploy secure, scalable, and highly available solutions that meet business and technical requirements. Professional-Cloud-Architect exam format consists of multiple-choice questions, and the candidate has two hours to complete the exam.

Latest Professional-Cloud-Architect Study Plan & Reliable Professional-Cloud-Architect Test Experience

There are many merits of our product on many aspects and we can guarantee the quality of our Google Certified Professional - Cloud Architect (GCP) Professional-Cloud-Architect practice engine. Firstly, our experienced expert team compile them elaborately based on the real exam. Secondly, both the language and the content of our Google Professional-Cloud-Architect Study Materials are simple.

Google Certified Professional - Cloud Architect (GCP) Sample Questions (Q151-Q156):

NEW QUESTION # 151

For this question, refer to the Dress4Win case study. Which of the compute services should be migrated as -is and would still be an optimized architecture for performance in the cloud?

- A. Hadoop/Spark deployed using Cloud Dataproc Regional in High Availability mode
- B. Jenkins, monitoring, bastion hosts, security scanners services deployed on custom machine types
- C. Web applications deployed using App Engine standard environment

- D. RabbitMQ deployed using an unmanaged instance group

Answer: A

NEW QUESTION # 152

You analyzed TerraEarth's business requirement to reduce downtime, and found that they can achieve a majority of time saving by reducing customer's wait time for parts. You decided to focus on reduction of the 3 weeks aggregate reporting time.

Which modifications to the company's processes should you recommend?

- A. Increase fleet cellular connectivity to 80%, migrate from FTP to streaming transport, and develop machine learning analysis of metrics
- B. Migrate from CSV to binary format, migrate from FTP to SFTP transport, and develop machine learning analysis of metrics
- C. Migrate from FTP to streaming transport, migrate from CSV to binary format, and develop machine learning analysis of metrics
- D. Migrate from FTP to SFTP transport, develop machine learning analysis of metrics, and increase dealer local inventory by a fixed factor

Answer: C

Explanation:

Explanation/Reference:

Explanation:

The Avro binary format is the preferred format for loading compressed data. Avro data is faster to load because the data can be read in parallel, even when the data blocks are compressed.

Cloud Storage supports streaming transfers with the gsutil tool or boto library, based on HTTP chunked transfer encoding. Streaming data lets you stream data to and from your Cloud Storage account as soon as it becomes available without requiring that the data be first saved to a separate file. Streaming transfers are useful if you have a process that generates data and you do not want to buffer it locally before uploading it, or if you want to send the result from a computational pipeline directly into Cloud Storage.

NEW QUESTION # 153

On-premises infrastructure

Google

The migration of JencoMart's application to Google Cloud Platform (GCP) is progressing too slowly. The infrastructure is shown in the diagram. You want to maximize throughput.

What are three potential bottlenecks? (Choose three.)

- A. A separate storage layer outside the VMs, which is not suited for this task
- B. A tier of Google Cloud Storage that is not suited for this task
- C. Complicated internet connectivity between the on-premises infrastructure and GCP
- D. A single VPN tunnel, which limits throughput
- E. A copy command that is not suited to operate over long distances
- F. Fewer virtual machines (VMs) in GCP than on-premises machines

Answer: A,D,E

NEW QUESTION # 154

Your company is moving 75 TB of data into Google Cloud. You want to use Cloud Storage and follow Google- recommended practices. What should you do?

- A. Install gsutil on each server containing data. Use streaming transfers to upload the data into Cloud Storage.
- B. Move your data onto a Transfer Appliance. Use Cloud Dataprep to decrypt the data into Cloud Storage.
- C. Move your data onto a Transfer Appliance. Use a Transfer Appliance Rehydrator to decrypt the data into Cloud Storage.
- D. Install gsutil on each server that contains data. Use resumable transfers to upload the data into Cloud Storage.

Answer: C

NEW QUESTION # 155

You are moving an application that uses MySQL from on-premises to Google Cloud. The application will run on Compute Engine and will use Cloud SQL. You want to cut over to the Compute Engine deployment of the application with minimal downtime and no data loss to your customers. You want to migrate the application with minimal modification. You also need to determine the cutover strategy. What should you do?

- A. 1. Set up Cloud SQL proxy and MySQL proxy.
2. Create a mysqldump of the on-premises MySQL server.
3. Upload the dump to a Cloud Storage bucket.
4. Import the dump into Cloud SQL.
5. Stop the on-premises application.
6. Start the Compute Engine application.
- B. 1. Stop the on-premises application.
2. Create a mysqldump of the on-premises MySQL server.
3. Upload the dump to a Cloud Storage bucket.
4. Import the dump into Cloud SQL.
5. Start the application on Compute Engine.
- C. 1. Set up Cloud VPN to provide private network connectivity between the Compute Engine application and the on-premises MySQL server.
2. Stop the on-premises application.
3. Start the Compute Engine application, configured to read and write to the on-premises MySQL server.
4. Create the replication configuration in Cloud SQL.
5. Configure the source database server to accept connections from the Cloud SQL replica.
6. Finalize the Cloud SQL replica configuration.
7. When replication has been completed, stop the Compute Engine application.
8. Promote the Cloud SQL replica to a standalone instance.
9. Restart the Compute Engine application, configured to read and write to the Cloud SQL standalone instance.
- D. 1. Set up Cloud VPN to provide private network connectivity between the Compute Engine application and the on-premises MySQL server.
2. Stop the on-premises application.
3. Create a mysqldump of the on-premises MySQL server.
4. Upload the dump to a Cloud Storage bucket.
5. Import the dump into Cloud SQL.
6. Modify the source code of the application to write queries to both databases and read from its local database.
7. Start the Compute Engine application.
8. Stop the on-premises application.

Answer: C

Explanation:

External replica promotion migration In the migration strategy of external replica promotion, you create an external database replica and synchronize the existing data to that replica. This can happen with minimal downtime to the existing database. When you have a replica database, the two databases have different roles that are referred to in this document as primary and replica. After the data is synchronized, you promote the replica to be the primary in order to move the management layer with minimal impact to database uptime. In Cloud SQL, an easy way to accomplish the external replica promotion is to use the automated migration workflow. This process automates many of the steps that are needed for this type of migration.

<https://cloud.google.com/architecture/migrating-mysql-to-cloudsql-concept>

- The best option for migrating your MySQL database is to use an external replica promotion. In this strategy, you create a replica database and set your existing database as the primary. You wait until the two databases are in sync, and you then promote your MySQL replica database to be the primary. This process minimizes database downtime related to the database migration. -

Our company is glad to provide customers with authoritative study platform. Our Professional-Cloud-Architect quiz torrent was designed by a lot of experts and professors in different area in the rapid development world. At the same time, if you have any question, we can be sure that your question will be answered by our professional personal in a short time. In a word, if you choose to buy our Professional-Cloud-Architect Quiz prep, you will have the chance to enjoy the authoritative study platform provided by our company. We believe our latest Professional-Cloud-Architect exam torrent will be the best choice for you.
