Quiz 2026 Zscaler Unparalleled ZDTE: Zscaler Digital Transformation Engineer Reliable Test Cram

Different with other similar education platforms on the internet, the Zscaler Digital Transformation Engineer guide torrent has a high hit rate, in the past, according to data from the students' learning to use the ZDTE test torrent, 99% of these students can pass the qualification test and acquire the qualification of their yearning, this powerfully shows that the information provided by the ZDTE study tool suit every key points perfectly, targeted training students a series of patterns and problem solving related routines, and let students answer up to similar topic. It may say, the ZDTE Test Torrent can let users in a short time, accurately grasp the proposition trend of each year, doing all effects in the process of the difficulties in the hot, user's weak link and targeted training, and exercise the user's solving problem ability, eventually achieve the objectives of the pass Zscaler Digital Transformation Engineer qualification test.

PDFTorrent provides updated and valid ZDTE Exam Questions because we are aware of the absolute importance of updates, keeping in mind the dynamic Zscaler ZDTE Exam Syllabus. We provide you update checks for 365 days after purchase for absolutely no cost. We also give a 25% discount on all ZDTE dumps.

Zscaler ZDTE Reliable Exam Labs & Study ZDTE Tool

ZDTE test guide is an examination material written by many industry experts based on the examination outlines of the calendar year and industry development trends. Its main purpose is to help students who want to obtain the certification of ZDTE to successfully pass the exam. Compared with other materials available on the market, the main feature of ZDTE exam materials doesn't like other materials simply list knowledge points. It allows students to find time-saving and efficient learning methods while memorizing knowledge points. With ZDTE study braindumps, learning from day and night will never happen. You can learn more with less time. You will become a master of learning in the eyes of others. With ZDTE study braindumps, successfully passing the exam will no longer be a dream.

Zscaler Digital Transformation Engineer Sample Questions (Q35-Q40):

NEW QUESTION # 35
What is the default classification for a newly discovered application in the App Inventory in the Third-Party App Governance Admin Portal?

- A. Unclassified
- B. Unsanctioned
- C. Reviewing
- D. Sanctioned

Answer: A

Explanation:

In Zscaler 3rd-Party App Governance documentation, the App Inventory is where administrators view and manage all discovered third-party apps, add-ons, and extensions. The "Classifying Apps" help article defines the available states: Unclassified, Sanctioned, Reviewing, and Unsanctioned. Crucially, it notes that Unclassified is the default state for any new application before an administrator evaluates it.

"Sanctioned" is used once the organization has explicitly approved an app for use; "Unsanctioned" is used when an app is not allowed; and "Reviewing" indicates it is under investigation. Those labels are the result of governance decisions applied after discovery.

ZDTE study materials on SaaS and app governance mirror this behavior: newly discovered apps enter the inventory without an explicit decision, allowing security teams to triage risk, review permissions, and only then mark them as sanctioned or unsanctioned. Because the default state for a new entry is explicitly documented as Unclassified, the correct answer is D. Unclassified.

NEW QUESTION # 36

Logging services exist in which part of the Zscaler architecture?

- A. Engines
- B. OneAPI
- C. Memory
- D. Brains

Answer: D

Explanation:

The Zscaler Digital Transformation study guides describe the Zero Trust Exchange using the conceptual model of "Brains and Engines." Engines are the inline enforcement components-ZIA Public Service Edges, ZPA Service Edges, App Connectors, etc.-that sit in the data path to forward traffic, apply policy, and perform inspection.

The "Brains" side, however, represents the cloud control and intelligence plane. Here Zscaler hosts components such as Central Authority, policy and configuration stores, analytics engines, and, critically, the Logging and Reporting infrastructure (Nanolog clusters, Log Streaming Service, and analytics dashboards). The documentation explicitly associates log collection, compression, forwarding to SIEM/SOAR platforms, and long-term analytics with this centralized cloud layer rather than the enforcement engines themselves.

Engines generate rich telemetry, but they stream it back to the brains layer, where it is normalized, indexed, retained, and made searchable for investigations, compliance, and performance analysis. OneAPI is an access interface, not the location of the logging services, and "Memory" is not a formal architectural construct in the Zscaler model. Therefore, in the official architecture view taught for the exam, logging services clearly reside in the Brains component of the platform.

NEW QUESTION # 37

What are common use cases of Zscaler OneAPI automation?

- A. Creating App Connector Groups and accessing ZDX Copilot.
- B. Creating App Connector Groups and enrolling users' device information.
- C. Enrolling users' device information and installing antivirus features in Zscaler Client Connector (ZCC).
- D. Creating URL filtering rules and accessing ZDX Copilot.

Answer: B

Explanation:

Zscaler OneAPI is designed as a unified, modern API layer that exposes core objects and workflows from ZIA, ZPA, and Zscaler Client Connector in a consistent way. In the Digital Transformation Engineer and Zero Trust Automation material, common and recommended use cases focus on automating tasks that are frequently repeated, error-prone, or need to scale across large environments.

For ZPA, a typical automation scenario is the creation and lifecycle management of App Connectors and App Connector Groups. These components provide the inside-out connectivity from private applications to the Zscaler cloud. Using OneAPI, administrators can programmatically create, update, and organize App Connector Groups, allowing infrastructure-as-code style deployment and rapid scaling of private access environments.

On the endpoint side, OneAPI also integrates with Zscaler Client Connector and identity-related services to enroll or update device information programmatically. This enables workflows such as onboarding new devices, synchronizing device attributes from external

systems, and tying device identity to access policy without manual portal operations.

By contrast, installing "antivirus features" in ZCC or "accessing ZDX Copilot" are not highlighted as core OneAPI automation use cases in the referenced curriculum, which makes option B the correct choice.

NEW QUESTION # 38

When using a Domain Joined posture element to allow access in a ZPA Access Policy, which statement is true?

- A. If a 2nd domain and a sub-domain are needed in the Access Policy rule you must create a 2nd posture profile with the other domain and add it to the Access Policy.
- B. Zscaler ZPA can contact the IDP such as Azure AD out-of-band to verify if a device is joined to a particular domain.
- C. Only some Linux operating systems have Domain Joined posture profile support in Zscaler.
- D. When a ZPA Browser Access client attempts to access an application, Zscaler can determine if that device is joined to a particular domain.

Answer: D

Explanation:
The Domain Joined posture element in ZPA evaluates whether a device belongs to a specific Active Directory domain. ZPA performs this evaluation using the device's local posture signals, either through the Zscaler Client Connector posture engine or through the browser-based posture evaluation framework used in ZPA Browser Access. When a user connects via Browser Access, ZPA can still determine domain membership by inspecting the allowed browser posture attributes provided by the endpoint, enabling device- based Zero Trust controls without requiring a full Client Connector installation.

Linux endpoints do not support domain-joined posture verification, making option A incorrect. Domain join validation is performed at the device level, not through the Identity Provider, because IdPs validate users, not device domain status, eliminating option D. ZPA's posture configuration allows you to define multiple domains within a single posture profile, so creating a second posture profile is unnecessary, making option C incorrect.

Therefore, the correct statement is that ZPA Browser Access can determine whether the device is joined to the specified domain, which aligns with the expected behavior of the domain-joined posture element.

NEW QUESTION # 39

An organization wants to upload internal PII (personally identifiable information) into the Zscaler cloud for blocking without fear of compromise. Which of the following technologies can be used to help with this?

- A. Dictionaries
- B. Engines
- C. IDM
- D. EDM

Answer: D

Explanation:
Zscaler's advanced data protection stack includes Exact Data Match (EDM), Indexed Document Match (IDM), dictionaries, and predefined DLP engines. Zscaler describes EDM as a technique that "fingerprints" sensitive values-such as PII from structured data sources (databases or spreadsheets)-so the platform can detect and block exact matches to those values while greatly reducing false positives.

With EDM, an on-premises index tool hashes the sensitive fields (for example, names, IDs, or other PII) and then uploads only these hashes-not the readable PII itself-into the Zscaler cloud. Zscaler documentation emphasizes that only hashed fingerprints are sent, allowing organizations to protect internal data "without having to transfer that data to the cloud" in plain form. This directly addresses the requirement to block exfiltration of internal PII without fear of compromise.

Dictionaries and core DLP engines focus on pattern- or keyword-based detection (such as generic PII patterns) rather than matching exact records from an internal dataset. IDM, on the other hand, fingerprints whole documents or forms (for example, templates or high-value documents) rather than row-level PII records. Therefore, for uploading organization-specific PII in a privacy-preserving, hashed form to enable precise blocking, EDM is the correct technology.
