

CPC-CDE-RECERT최신업데이트시험덤프, CPC-CDE-RECERT높은통과율공부문제

Pass4Test전문가들은CyberArk CPC-CDE-RECERT인증시험만을 위한 특별학습가이드를 만들었습니다.CyberArk CPC-CDE-RECERT인증시험을 응시하려면 30분이란 시간만 투자하여 특별학습가이드로 빨리 관련지식을 장악하고,또 다시 복습하고 안전하게CyberArk CPC-CDE-RECERT인증시험을 패스할 수 있습니다.자격증취득 많은 시간과 돈을 투자한 분들보다 더 가볍게 이루어졌습니다

CyberArk CPC-CDE-RECERT Exam Syllabus Topics:

Section	Weight	Objectives
Management & Operations	25%	- Backup and disaster recovery - Monitoring, logging and health checks - Updates, upgrades and maintenance
Configuration & Deployment	30%	- Integration with identity providers and directories - Security hardening and compliance settings - Installation and setup procedures
Privilege Cloud Connectors Architecture & Components	25%	- Service communication and ports - Core architecture and service components - Deployment models and requirements
Troubleshooting & Optimization	20%	- Performance tuning and best practices - Security incident handling - Common issues and resolution

CPC-CDE-RECERT높은 통과율 공부문제 & CPC-CDE-RECERT자격증덤프

지난 몇년동안 IT산업의 지속적인 발전과 성장을 통해CyberArk 인증CPC-CDE-RECERT시험은 IT인증시험중의 이정표로 되어 많은 인기를 누리고 있습니다. IT인증시험을Pass4Test덤프로 준비해야만 하는 이유는Pass4Test덤프는 IT업계전문가들이 실제시험문제를 연구하여 시험문제에 대비하여 예상문제를 제작했다는 점에 있습니다.

최신 CyberArk Certification CPC-CDE-RECERT 무료샘플문제 (Q96-Q101):

질문 # 96

In large-scale environments, it is important to enable the CPM to focus its search operations on specific Safes instead of scanning all Safes it sees in the Vault. How is this accomplished?

- A. Administration Options > CPM Settings
- **B. AllowedSafes Parameter on each platform policy**
- C. Administration > Options > CPM Scanner.
- D. MaxConcurrentConnection parameter on each platform policy

정답: B

설명:

In large-scale environments, to enable the Central Policy Manager (CPM) to focus its search operations on specific Safes instead of scanning all Safes it sees in the Vault, the AllowedSafes parameter on each platform policy is used. This parameter can be configured within the platform settings in the CyberArk administration interface. By specifying safes in the AllowedSafes parameter, the CPM will only manage credentials within those designated safes, thereby optimizing performance and managing resources more efficiently by not scanning unnecessary safes. This setting is crucial for large environments where the CPM needs to be as efficient as possible due to the volume of managed accounts.

질문 # 97

Before you can delete a Safe, you must first delete all of its content (accounts and files) permanently. What else must also be achieved before the Safe can be successfully deleted?

- A. The "Save account versions for a period of:" has been set to 0 within the Safe version retention settings.
- B. The associated CPM user has been removed from the Safe.
- **C. The version retention period has expired for all files.**
- D. The Safe owners have been removed from the Safe membership.

정답: C

설명:

CyberArk states that a Safe can be deleted only after its contents are deleted permanently, and (critically) objects are only deleted permanently after their retention/versions retention has passed. In the Privilege Cloud Safe management documentation, it notes that accounts are deleted permanently only after their retention period has passed, which is why deletion can be blocked by "non-expired" objects.

The underlying Vault/PACLI behavior is also explicit: "It is only possible to delete a Safe after the version retention period has expired for all files contained in the Safe." So, beyond deleting the content, the version retention period must have expired for all files # B.

질문 # 98

Which statement is correct about using the AllowedSafes platform parameter?

- **A. It prevents the CPM from scanning all safes, restricting it to scan only safes that match the AllowedSafes configuration.**
- B. It allows the CPM to access PSM safes to monitor platform configuration and connection component changes.
- C. It prevents the CPM from processing pending items in the Discovery safes enforcing manual intervention to complete the onboarding process.
- D. It allows users to access accounts in specific safes.

정답: A

설명:

The correct statement about using the AllowedSafes platform parameter is that it prevents the Central Policy Manager (CPM) from scanning all safes, restricting it to scan only safes that match the AllowedSafes configuration. This parameter is crucial in large-scale deployments where efficiency and resource management are key. By specifying which safes the CPM should manage, unnecessary scanning of irrelevant safes is avoided, thus optimizing the CPM's performance and reducing the load on the CyberArk environment. This configuration can be found in the platform management section of the CyberArk documentation.

질문 # 99

What is the default username for the PSM for SSH maintenance user?

- A. psnmpmaintenanceuser
- B. proxyusr

- C. psmp_maintenance
- D. proxyimg

정답: D

설명:

<https://docs.cyberark.com/pam-self-hosted/latest/en/content/pasimp/administrating-the-psmp.htm#Createamaintenanceuser>

질문 # 100

You plan to install the Privilege Cloud Connector on Windows Server 2019 and must leverage your existing RDS Per-user licenses for PSM connections. What must you do?

- A. Modify the UseRDSPerUser parameter to Yes on every Windows-related platform.
- B. Add the UseRDSPerUser=Yes line to the basic_psm.ini parameters file.
- C. Install the RDS License Server Service on Windows 2016.
- D. Migrate the local PSMConnect users to Domain users.

정답: D

설명:

CyberArk documents that due to RDS licensing enforcement in Windows 2019/2022, Per-user licensing is not supported for local users, and (when Per-user CALs are required) you should move the built-in PSM application users (PSMConnect / PSMAdminConnect) from local to domain users.

Therefore, to leverage existing Per-user RDS licensing on Windows 2019 PSM servers, you must migrate the local PSM users to domain users # C.
