Valid Brindumps 156-587 Sheet | 156-587 Valid Study Guide

If you are going to attend the 156-587 exam, and want to get the certificate of the 156-587 exam, then consider the product of our company, since the pass rate of our company are above 98%, and if you attend the exam and failed it within 60 days after the purchasing, money back guarantee. Just think that you just need to spend some money for the 156-587 Exam, you will get the certificate of the business, and you not just have a more certificate than others, it's not only a skill, but also a chance. With the certificate for the 156-587 exam, you are approved by the professionals and you are also a professional in this industry.

CheckPoint Check Point Certified Troubleshooting Expert - R81.20 Sample Questions (Q28-Q33):

NEW QUESTION # 28

Which of the following commands can be used to see the list of processes monitored by the Watch Dog process?

- A. `ps -ef| grep watchd`
- B. `cpstat fw -f watchdog`
- C. `fw ctl get str watchdog`
- D. `cpwd_admin list`

Answer: D

Explanation:

To see the list of processes monitored by the WatchDog process (CPWD), you use the `cpwd_admin list` command.

Option A (`cpstat fw -f watchdog`): Shows firewall status and statistics for the "fw" context, not necessarily the list of monitored processes.

Option B (`fw ctl get str watchdog`): Not a valid parameter for retrieving the list of monitored processes; "fw ctl" deals with kernel parameters.

Option C (`cpwd_admin list`): Correct command that lists all processes monitored by CPWD, their status, and how many times they have been restarted.

Option D (`ps -ef| grep watchd`): This will list any running process that matches the string "watchd" but will not specifically detail which processes are being monitored by CPWD.

Therefore, the best answer is `cpwd_admin list`.

Check Point Troubleshooting Reference

sk97638: Explains Check Point WatchDog (CPWD) usage and the `cpwd_admin` utility.

R81.20 CLI Reference Guide: Describes common troubleshooting commands including `cpwd_admin list`.

Check Point Gaia Administration Guide: Provides instructions for monitoring system processes and verifying CPWD.

NEW QUESTION # 29

In Mobile Access VPN, clientless access is done using a web browser. The primary communication path for these browser based connections is a process that allows numerous processes to utilize port 443 and redirects traffic to a designated port of the respective process.

Which daemon handles this?

- A. HTTPS Inspection Daemon (HID)
- B. Mobile Access Daemon (MAD)
- C. Connectra VPN Daemon (cvpnd)
- D. Multi-portal Daemon

Answer: D

NEW QUESTION # 30

The Check Point Watch Daemon (CPWD) monitors critical Check Point processes, terminating them or restarting them as needed to maintain consistent, stable operating conditions. When checking the status/output of CPWD you are able to see some columns like APP, PID, STAT, START, etc. What is the column "STAT" used for?

- A. Shows the Watch Dog name of the monitored process
- B. Shows how many times the Watch Dog started the monitored process
- C. Shows what monitoring method Watch Dog is using to track the process
- D. Shows the status of the monitored process

Answer: D

Explanation:

The STAT column in the output of the `cpwd_admin list` command shows the status of the monitored process. The possible values are E for established, meaning that the process is running, or T for terminated, meaning that the process is not running. The STAT column is useful for quickly checking if any critical process has crashed or failed to start. If the value is T, the process should be restarted and the reason for the termination should be investigated. The STAT column does not show the Watch Dog name, the number of times the process was started, or the monitoring method of the Watch Dog.

NEW QUESTION # 31

What cli command is run on the GW to verify communication to the Identity Collector?

- A. pep connections idc
- B. show idc connections
- C. fwd connected
- **D. pdp connections idc**

Answer: D

NEW QUESTION # 32

John has renewed his NPTX License but he gets an error (contract for Anti-Bot expired). He wants to check the subscription status on the CLI of the gateway, what command can he use for this?

- A. cpstat antimalware-f subscription status
- B. fwm lic print
- **C. show license status**
- D. fw monitor license status

Answer: C

Explanation:

The correct command to check the subscription status on the CLI of the gateway is show license status. This command displays the current license information, such as the license type, expiration date, and subscription status for various blades, such as Anti-Bot, Anti-Virus, IPS, etc. The command also shows the contract status for each blade, such as valid, expired, or invalid. If John has renewed his NPTX license, but he gets an error that the contract for Anti-Bot expired, he can use this command to verify the contract status and the subscription status for the Anti-Bot blade.

The other commands are incorrect because:

- * A. fwm lic print is not a valid command. The correct command is fwm lic print, which displays the license information on the Security Management Server, not on the gateway. This command does not show the subscription status or the contract status for the blades.
- * B. fw monitor license status is not a valid command. The correct command is fw monitor, which is a tool for capturing network traffic on the gateway, not for checking the license status.
- * C. cpstat antimalware-f subscription status is not a valid command. The correct command is cpstat antimalware -f subscription_status, which displays the subscription status for the Anti-Virus blade, not for the Anti-Bot blade. This command does not show the contract status for the blade.
