NEW QUESTION # 70

Which two of the following points can be checked when the node status is "unknown"? (Choose two.)

- A. polling method
- B. OID
- C. ping response
- D. view method

Answer: A,C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When a node status is "unknown," it often means the SolarWinds platform cannot communicate with the node. The first checks should be:

Ping response: Verify if the node is reachable via ICMP ping, as lack of response leads to an unknown status.

Polling method: Confirm the correct polling method (ICMP, SNMP, WMI, API) is configured and functioning.

OID (A) is related to SNMP but not directly to basic node status, and view method (D) is not a relevant diagnostic step.

"Check basic reachability (ping) and confirm the polling method is correct..."
