## Fortinet FCSS - Enterprise Firewall 7.4 Administrator Sample Questions (Q26-Q31):

### NEW QUESTION # 26

An administrator has been assigned the task of creating a set of firewall policies which must be evaluated before any custom policies defined within the policy packages of managed FortiGate devices, across all 25 ADOMs in FortiManager.

How should the administrator accomplish this task?

- A. Create a header policy in the Global ADOM containing the firewall policies that must be evaluated first, and then assign this header policy to all other ADOMs.
- B. Use a CLI script from the root ADOM on FortiManager to push these new policies to all FortiGate devices, through the FGFM tunnel.
- C. Move the FortiGate devices into a single globally scoped ADOM, and merge policy packages, inserting the new firewall policies at the top.
- D. Create a footer policy in the Global ADOM containing the firewall policies that must be evaluated first, and then assign this footer policy to all other ADOMs.

**Answer: A**

What can you conclude from the output shown in the exhibit? (Choose two.)

- A. Traffic in the original direction (coming from the IP address 10.171.121.38) will be routed to the next- hop IP address 10.200.1.1.
- B. This is a pinhole session created to allow traffic for a protocol that requires additional sessions to operate through FortiGate.
- C. This is an expected session created by the IPS engine.
- D. Traffic in the original direction (coming from the IP address 10.171.121.38) will be routed to the next- hop IP address 10.0.1.10.

**Answer: B,D**

#### NEW QUESTION # 30

An administrator is checking an enterprise network and sees a suspicious packet with the MAC address e0:23:fffc:00:86. What two conclusions can the administrator draw? (Choose two.)

- A. The suspicious packet is related to a cluster with a group-id value lower than 255.
- B. The network includes FortiGate devices configured with the FGSP protocol.
- C. The suspicious packet is related to a cluster that has VDOMs enabled.
- D. The suspicious packet corresponds to port 7 on a FortiGate device.

**Answer: A,C**

Explanation:

The MAC address e0:23:fffc:00:86 follows the format used in FortiGate High Availability (HA) clusters. When FortiGate devices are in an HA configuration, they use virtual MAC addresses for failover and redundancy purposes.

The suspicious packet is related to a cluster that has VDOMs enabled:

FortiGate devices with Virtual Domains (VDOMs) enabled use specific MAC address ranges to differentiate HA-related traffic.

This MAC address is likely part of that mechanism.

The suspicious packet is related to a cluster with a group-id value lower than 255:

FortiGate HA clusters assign virtual MAC addresses based on the group ID. The last octet (00:86) corresponds to a group ID that is below 255, confirming this option.
