## **ECCouncil EC-Council Certified DevSecOps Engineer (ECDE) Sample Questions (Q73-Q78):**

### **NEW QUESTION # 73**

(Matt LeBlanc has been working as a DevSecOps engineer in an IT company that develops software products and web applications for IoT devices. His team leader has asked him to use GitRob tool to find sensitive data in the organizational public GitHub repository. To install GitRob, Matt ensured that he has correctly configured Go  $\geq$  1.8 environment and that \$GOPATH/bin is in his \$PATH. The GitHub repository URL from which he is supposed to install the tool is <https://github.com/michenriksen/gitrob>. Which of the following command should Matt use to install GitRob?.)

- A. `$ go get gitrob github.com/michenriksen/gitrob.`
- B. `$ go git github.com/michenriksen/gitrob.`
- C. `$ go get github.com/michenriksen/gitrob.`
- D. `$ go git gitrob github.com/michenriksen/gitrob.`

**Answer: C**

Explanation:

In Go-based tool installation, the standard method to download, compile, and install a Go package is using the `go get` command followed by the repository import path. Since Matt has already ensured that Go version 1.8 or later is installed and that \$GOPATH/bin is included in the system PATH, running `go get github.com/michenriksen/gitrob` will fetch the GitRob source code, build the binary, and place it in the appropriate bin directory. Options B, C, and D are invalid because `go get` does not accept multiple positional arguments in that manner, and `go git` is not a valid Go command. Installing GitRob during the Code stage enables DevSecOps teams to scan repositories for accidentally committed credentials, API keys, and other sensitive information, helping prevent data leakage from public repositories.

### **NEW QUESTION # 74**

(Helena Luke has been working as a DevSecOps engineer in an IT company located in Denver, Colorado. To seamlessly secure source code during build time and enhance the runtime protection functionalities to the source code, she would like to integrate Jscrambler with GitLab. Therefore, she selected a predefined template and successfully downloaded the Jscrambler configuration file. She then placed the file in the project's root folder and renamed it as `.jscramblerrc`. To prevent the exposure of sensitive information, she opened the Jscrambler configuration file and removed the access and secret keys from it. In which of the following formats does the Jscrambler configuration file exist?.)

- A. HTML.
- B. JSON.
- C. YAML.
- D. XML.

**Answer: B**

Explanation:

The Jscrambler configuration file `.jscramblerrc` is written in JSON format. JSON is widely used for configuration because it is lightweight, human-readable, and easily parsed by tools in CI/CD pipelines.

Removing access and secret keys from this file is a recommended security practice to prevent credential leakage when the repository is shared or stored in version control. Instead, credentials are typically injected through environment variables or secure CI/CD secrets. XML, YAML, and HTML are not the formats used by Jscrambler for its primary configuration file. Using JSON-based configuration during the Code stage allows consistent integration with GitLab pipelines while maintaining secure handling of sensitive data.

### **NEW QUESTION # 75**

(Maria Howell is working as a senior DevSecOps engineer at Global SoftSec Pvt. Ltd. Her team is currently working on the development of a cybersecurity software. There are 5 developers who are working on code development. Howell's team is using a private GitHub repository for the source code development. Which of the following commands should Howell use to grab the online updates and merge them with her local work?.)

- A. `$ git grabs remotename branchname.`
- B. `$ git get remotename branchname.`
- C. `$ git push remotename branchname.`
- **D. `$ git pull remotename branchname.`**

**Answer: D**

Explanation:

The `git pull` command is used to fetch changes from a remote repository and automatically merge them into the current local branch. In collaborative development environments, especially when multiple developers are committing code to a shared repository, regularly pulling updates is essential to stay synchronized and avoid merge conflicts. The syntax `git pull <remote-name> <branch-name>` correctly specifies the source of the updates. Commands such as `git get` and `git grabs` do not exist in Git, and `git push` performs the opposite action by sending local changes to the remote repository rather than retrieving updates. Using `git pull` during the Code stage supports continuous collaboration and ensures that developers integrate the latest changes securely and efficiently.

#### NEW QUESTION # 76

(Lisa Kramer carries an experience of 4 years as a DevSecOps engineer in an IT company. The software development team of her organization has developed a Ruby on Rails web application and would like to find vulnerabilities in Ruby dependencies. Therefore, the team leader of the software development team approached Lisa for help in this regard. Which of the following SCA tool should Lisa use to detect vulnerabilities in Ruby dependencies?)

- **A. Bundler-Audit.**
- B. Retire.js.
- C. Tenable.io.
- D. Bandit.

**Answer: A**

Explanation:

Bundler-Audit is an SCA tool designed specifically for Ruby applications. It analyzes the Gemfile and Gemfile.lock to identify dependencies and checks them against known vulnerability databases. Bandit is intended for Python code analysis, Retire.js targets JavaScript libraries, and Tenable.io focuses on infrastructure-level vulnerabilities. By using Bundler-Audit during the Code stage, DevSecOps teams can detect vulnerable Ruby gems early and ensure that only secure dependencies are used. This reduces the risk of exploiting known vulnerabilities in third-party libraries and supports secure dependency management throughout the development lifecycle.

#### NEW QUESTION # 77

(Andrew Gerrard has recently joined an IT company that develops software products and applications as a DevSecOps engineer. His team leader asked him to download a jar application from the organization GitHub repository and run the BDD security framework. Andrew successfully downloaded the jar application from the repository and executed the jar application; then, he cloned the BDD security framework. Which of the following commands should Andrew use to execute the authentication feature?.)

- A. `./gradlew -Dcucumber.options="-tags @authentication -tags @skip".`
- B. `./gradlew -Dcucumber.options="-tags @authentication -tags ~@skip".`
- C. `./gradlew -Dcucumber.options="-tags @authentication -tags @skip".`
- **D. `./gradlew -Dcucumber.options="-tags @authentication -tags ~@skip".`**

**Answer: D**

Explanation:

The BDD Security framework is executed through Gradle wrapper commands, and the correct wrapper script on Unix-like systems is `./gradlew` (dot-slash indicates "run the wrapper from the current directory"). Options using `/gradlew` or `/gradlev` imply an absolute

path at filesystem root and are typically incorrect for a cloned project. Also, the wrapper name is gradlew, not gradlev. For executing only the authentication feature (or scenarios tagged for authentication), Cucumber tag expressions are used through the -Dcucumber.options system property. The command must include --tags @authentication to select authentication-tagged scenarios. To skip scenarios tagged "skip," the exclusion operator is used as --tags ~@skip (meaning "exclude @skip"). Options A and B incorrectly include --tags @skip which would include skipped tests rather than exclude them. Therefore, ./gradlew -Dcucumber.options="--tags @authentication --tags ~@skip" is the correct choice to run authentication scenarios while excluding anything marked to skip.
