You can totally rely on our products for your future learning path.

SAP Certified Associate - Integration Developer Sample Questions (Q44-Q49):

NEW QUESTION # 44

To receive the "sap/s4/beh/businesspartner/va/BusinessPartner/Changed/v1" business event from SAP S/4HANA Cloud in SAP Integration Suite Event Mesh, which components are required to construct the Topic Subscription string?

- A. API key Authentication token Client ID
- B. Business Partner ID Change type Event timestamp
- C. Source system Target system Integration flow
- **D. Namespace Topic name Separator.**

Answer: D

Explanation:

In SAP Event Mesh, topic subscriptions follow a defined hierarchical string structure:

Namespace # Defines the domain or context (e.g., sap/s4/beh/businesspartner).

Topic name # Specifies the exact event (e.g., BusinessPartner/Changed).

Separators (/) # Used to concatenate namespace and event details into a full subscription string.

Other options:

API key, Client ID, and Authentication token # Used for connectivity but not part of the topic string.

Business Partner ID, Change type, Event timestamp # Payload details, not part of the subscription string.

Source/Target system # Not required for constructing the topic name.

Thus, the correct components are Namespace, Topic name, Separator.

NEW QUESTION # 45

Where can you configure a static payload? Note: There are 2 correct answers to this question.

- A. In a Content Modifier component of the Message Header tab
- **B. In a Content Modifier component of the Message Body tab**
- C. In a Groovy script
- **D. In a Data Store Operation component**

Answer: B,D

Explanation:

You can configure a static payload in a Data Store Operation component or in a Content Modifier component of the Message Body tab. A Data Store Operation component allows you to store or retrieve messages in a data store. You can use the Write operation to store a static payload in a data store entry with a specified key. A Content Modifier component allows you to modify the message content, headers, and properties. You can use the Message Body tab to define a static payload for the message. Reference: Modernize Integration with SAP Integration Suite | openSAP

NEW QUESTION # 46

Which log level must you use to examine the payload at specific processing steps in an integration flow?

- A. Debug
- B. Error
- C. Info
- **D. Trace**

Answer: D

Explanation:

In SAP Cloud Integration, the log levels are:

Info # Default, logs basic execution details.

Debug # Logs processing steps, but not message payload.

Error # Logs only failures.

Trace # Captures message payloads at specific processing steps, used for deep troubleshooting.

Thus, to examine payload at runtime, the log level must be set to Trace.

NEW QUESTION # 47

You use an outbound HTTP adapter with basic authentication. In SAP Integration Suite, Monitor Integrations Manage Security, where must you set up and store a user and password?

- **A. Security Material**

- B. PGP Keys
- C. Access policies
- D. Keystore

Answer: A

Explanation:

To use basic authentication for outbound HTTP connections, you must store the user and password as credentials in the security material of SAP Integration Suite. Credentials are a type of security artifact that can be used to authenticate against external systems. You can create and manage credentials in the Monitor Integrations Manage Security Security Material section of SAP Integration Suite. Reference: Setting Up Outbound HTTP Connections with Basic Authentication | SAP Help Portal, Security Artifact Renewal for HTTPS-Based Communication | SAP Help Portal

NEW QUESTION # 48

What must you do to find out which entity sets are available in the OData V2.0 interface?

- A. Retrieve the service document from the interface.
- **B. Retrieve the metadata document from the interface.**
- C. Contact the OData interface manufacturer
- D. Search in the Global Directory of all available OData interfaces.

Answer: B

Explanation:

To find out which entity sets are available in the OData V2.0 interface, you must retrieve the metadata document from the interface. The metadata document is an XML document that describes the data model of the OData service, including the entity types, entity sets, associations, functions, and actions. The metadata document can be accessed by appending \$metadata to the service root URL of the OData service. For example, if the service root URL is <https://services.odata.org/OData/OData.svc/>, then the metadata document URL is [https://services.odata.org/OData/OData.svc/\\$metadata](https://services.odata.org/OData/OData.svc/$metadata). The metadata document can be used to discover the structure and capabilities of the OData service and to generate client code or proxies.
