#### NEW QUESTION # 110

Your customer wants to know more about the network configuration within the cluster.

In this scenario, which statement is correct about a LIF?

- A. A LIF separates network domains to access cluster data.
- B. A LIF is created within a broadcast domain and contains a pool of IP addresses.
- C. A LIF is a port that provides physical connections.
- D. A LIF is an IP address or a WWPN that is associated with a port.

**Answer: D**

Explanation:

In ONTAP SAN concepts, a Logical Interface (LIF) represents a logical network access point used by clients, hosts, or internal cluster services to communicate with storage. A LIF is not a physical port; rather, it is an abstraction that allows ONTAP to provide network resiliency and flexibility.

A LIF can be defined as either an IP address (used for NAS, management, and intercluster traffic) or a World Wide Port Name (WWPN) (used for SAN protocols such as FC and FCoE). Each LIF is associated with a physical port but can fail over to other ports based on defined policies, ensuring continuous access during failures or maintenance.

Broadcast domains define Layer 2 network groupings for ports, but they do not contain pools of IP addresses.

IP address pools are defined in subnets, not broadcast domains. Physical ports provide connectivity, but they do not represent LIFs themselves. Separating network domains is handled by IP spaces, not LIFs.

Therefore, the correct description of a LIF is that it is an IP address or WWPN associated with a port, making option C correct.

#### NEW QUESTION # 111

You need to create a configuration spreadsheet template for a new ONTAP 9.8 deployment. Which NetApp tool should you use?
