## VMware vSphere 8.x Advanced Design Sample Questions (Q77-Q82):

### NEW QUESTION # 77

An architect is designing a new workload domain in an existing VMware Cloud Foundation environment. The customer requirement is to physically separate the vSAN network traffic from other management network flows.

Which design decision should the architect make to meet this requirement?

- A. Deploy the new workload domain using a vSAN stretched cluster.
- B. Deploy the new workload domain using API.
- C. Deploy the new workload domain using multiple physical adapters.**
- D. Deploy the new workload domain using SDDC Manager.

### Answer: C

Explanation:

To physically separate the vSAN network traffic from other management network flows, the architect should configure the workload domain with multiple physical adapters. This will ensure that the vSAN traffic (which uses specific network ports and protocols) is isolated from other management traffic. By using separate physical adapters, the network traffic for each type can be kept distinct, reducing the risk of congestion and ensuring that each traffic type has dedicated bandwidth.

### NEW QUESTION # 78

An architect is documenting the design for a new multi-site vSphere solution. The customer has informed the architect that the workloads hosted on the solution are managed by application teams, who must perform a number of steps to return the application to service following a failover of the workloads to the secondary site.

These steps are defined as the Work Recovery Time (WRT). The customer has provided the architect with the following information about the workloads:

Critical workloads have a WRT of 12 hours

Production workloads have a WRT of 24 hours

Development workloads have a WRT of 24 hours

All workloads have an RPO of 4 hours

Critical workloads have an RTO of 1 hour

Production workloads have an RTO of 12 hours

Development workloads have an RTO of 24 hours

The customer has also confirmed that the Disaster Recovery solution will not begin the recovery of the development workloads until all critical and production workloads have been recovered at the secondary site.

What would the architect document as the maximum tolerable downtime (MTD) for each type of workload in the design?

- A. Critical Workloads: 13 hours Production Workloads: 36 hours Development Workloads: 48 hours
- B. Critical Workloads: 12 hours Production Workloads: 24 hours Development Workloads: 24 hours
- C. Critical Workloads: 13 hours Production Workloads: 36 hours Development Workloads: 60 hours
- D. Critical Workloads: 16 hours Production Workloads: 28 hours Development Workloads: 28 hours

**Answer: C**

#### **NEW QUESTION # 79**

Refer to the exhibit.

During a requirements gathering workshop, the customer shares the following about their existing ESXi host virtual networking infrastructure:

The customer confirms that:

- Each ESXi host has approximately 200 virtual machines.
- They want to maximize the number of concurrent virtual machine migrations.
- When placing a host in maintenance mode, it takes a long time to evacuate the virtual machines.

Which two recommendations should the architect make in order to help the customer overcome their challenge? (Choose two.)

- A. Use the 3 pNICs and bundle them in a link aggregation group (LAG) configuration
- B. Create an additional standard switch with pNIC3 to use for vMotion
- C. Configure the network to use MTU for the VMotion VMKernel to 9,000 bytes
- D. Configure the network to use MTU for the VMotion VMKernel to 1,600 bytes
- E. Use 10 GbE NICs instead of 1 GbE

**Answer: C,E**

#### **NEW QUESTION # 80**

Which requirement would be classified as a functional requirement within the design documentation?

- A. The system must be able to scale to support 500 concurrent virtual machines.
- B. The system must perform virtual machine backups through an API.
- C. Virtual machines must be restarted within 30 minutes of a host failure.
- D. Virtual machines must be patched within one month of the patch release date.

**Answer: A**

Explanation:

Product feature = functional requirement

#### **NEW QUESTION # 81**

How is the physical and virtual networking topology different in a vSphere environment?

- A. Physical networking refers to the physical network infrastructure, while virtual networking refers to the virtual switches and port groups in vSphere.
- B. Physical networking refers to the virtual switches and port groups in vSphere, while virtual networking refers to physical switches and routers.
- C. Physical networking involves software-defined networking, while virtual networking involves physical network switches and routers.
- D. Physical networking and virtual networking are synonymous terms used interchangeably.

**Answer: A**
