Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q306-Q311):

NEW QUESTION # 306

A root account owner is trying to setup an additional level of security for all his IAM users. Which of the below mentioned options is a recommended solution for the account owner?

- A. Enable access key and secret access key for all the IAM users
- B. Enable the password for all the IAM users
- C. Enable MFA for the root account
- **D. Enable MFA for all IAM users**

Answer: D

Explanation:

Multi-Factor Authentication adds an extra level of security for all the users. The user can enable MFA for all IAM users which ensures that each user has to provide an extra six digit code for authentication.

NEW QUESTION # 307

A Developer is creating a Lambda function and will be using external libraries that are not included in the standard Lambda libraries. What action would minimize the Lambda compute time consumed?

- A. Install the external libraries in Lambda to be available to all Lambda functions.
- B. Install the dependencies and external libraries at the beginning of the Lambda function.
- C. Copy the external libraries to Amazon S3, and reference the external libraries to the S3 location.
- **D. Create a Lambda deployment package that includes the external libraries.**

Answer: D

Explanation:

Explanation

AWS documentation - Lambda Best Practices

Control the dependencies in your function's deployment package. The AWS Lambda execution environment contains a number of libraries such as the AWS SDK for the Node.js and Python runtimes (a full list can be found here: [Lambda Execution Environment and Available Libraries](#)). To enable the latest set of features and security updates, Lambda will periodically update these libraries. These updates may introduce subtle changes to the behavior of your Lambda function. To have full control of the dependencies your function uses, we recommend packaging all your dependencies with your deployment package.

NEW QUESTION # 308

A user is planning to host a scalable dynamic web application on AWS. Which of the services may not be required by the user to achieve automated scalability?

- A. CloudWatch
- B. AWS EC2 instances
- C. AutoScaling
- **D. S3**

Answer: D

Explanation:

The user can achieve automated scaling by launching different EC2 instances and making them a part of an ELB. Cloudwatch will be used to monitor the resources and based on the scaling need it will trigger policies. AutoScaling is then used to scale up or down the instances.

NEW QUESTION # 309

A Developer is writing a mobile application that allows users to view images from an S3 bucket. The users must be able to log in with their Amazon login, as well as Facebook?and/or Google?accounts. How can the Developer provide this authentication functionality?

- A. Use Amazon Cognito with web identity federation.
- B. Use AWS IAM Access/Secret keys in the application code to allow Get* on the S3 bucket.
- C. Use AWS STS AssumeRole in the application code and assume a role with Get* permissions on the S3 bucket.
- D. Use Amazon Cognito with SAML-based identity federation.

Answer: A

NEW QUESTION # 310

A company wants to share information with a third party. The third party has an HTTP API endpoint that the company can use to share the information. The company has the required API key to access the HTTP API. The company needs a way to manage the API key by using code. The integration of the API key with the application code cannot affect application performance. Which solution will meet these requirements MOST securely?

- A. Store the API credentials in AWS Secrets Manager. Retrieve the API credentials at runtime by using the AWS SDK. Use the credentials to make the API call.
- B. Store the API credentials as an object in a private Amazon S3 bucket. Restrict access to the S3 object by using IAM policies. Retrieve the API credentials at runtime by using the AWS SDK. Use the credentials to make the API call.
- C. Store the API credentials in an Amazon DynamoDB table. Restrict access to the table by using resource- based policies. Retrieve the API credentials at runtime by using the AWS SDK. Use the credentials to make the API call.
- D. Store the API credentials in a local code variable. Push the code to a secure Git repository. Use the local code variable at runtime to make the API call.

Answer: A

Explanation:

AWS Secrets Manager is a service that helps securely store, rotate, and manage secrets such as API keys, passwords, and tokens. The developer can store the API credentials in AWS Secrets Manager and retrieve them at runtime by using the AWS SDK. This solution will meet the requirements of security, code management, and performance. Storing the API credentials in a local code variable or an S3 object is not secure, as it exposes the credentials to unauthorized access or leakage. Storing the API credentials in a DynamoDB table is also not secure, as it requires additional encryption and access control measures. Moreover, retrieving the credentials from S3 or DynamoDB may affect application performance due to network latency.
