## CompTIA Security+ Certification Exam Sample Questions (Q168-Q173):

### NEW QUESTION # 168

An administrator has configured a quarantine subnet for all guest devices that connect to the network. Which of the following would be best for the security team to perform before allowing access to corporate resources?

- A. Application vulnerability test
- B. Device fingerprinting
- C. Compliance attestation
- D. Penetration test

**Answer: C**

### NEW QUESTION # 169

Which of the following is the most likely to be used to document risks, responsible parties, and thresholds?

- A. Risk tolerance
- B. Risk analysis
- C. Risk register
- D. Risk transfer

**Answer: C**

Explanation:

A risk register is a document that records and tracks the risks associated with a project, system, or organization. A risk register typically includes information such as the risk description, the risk owner, the risk probability, the risk impact, the risk level, the risk response strategy, and the risk status. A risk register can help identify, assess, prioritize, monitor, and control risks, as well as communicate them to relevant stakeholders. A risk register can also help document the risk tolerance and thresholds of an organization, which are the acceptable levels of risk exposure and the criteria for escalating or mitigating risks. ### NEW QUESTION # 170

Which of the following is the act of proving to a customer that software developers are trained on secure coding?

- A. Attestation
- B. Assurance
- C. Contract
- D. Due diligence

**Answer: A**

Explanation:

Attestation refers to providing formal evidence or proof that a particular process or activity has been completed according to standards or requirements. In this context, attestation involves demonstrating to customers or stakeholders that software developers have received appropriate training on secure coding practices.

Assurance generally refers to confidence or guarantees about the security posture but does not specifically mean proving or certifying training. Due diligence is the effort made to ensure compliance or safety, but it is not the act of proving training has occurred. A contract is a legal agreement, which may include requirements for training but is not the act of proving training itself.

The importance of attestation in compliance and governance processes is discussed in the Security Program Management and Oversight domain in SY0-701 materials#7:Chapter 5†CompTIA Security+ Practice Tests#.

#### **NEW QUESTION # 171**

During an investigation, an incident response team attempts to understand the source of an incident. Which of the following incident response activities describes this process?

- A. Detection
- B. Lessons learned
- C. Containment
- **D. Analysis**

**Answer: D**

Explanation:

Analysis is the incident response activity that describes the process of understanding the source of an incident. Analysis involves collecting and examining evidence, identifying the root cause, determining the scope and impact, and assessing the threat actor's motives and capabilities. Analysis helps the incident response team to formulate an appropriate response strategy, as well as to prevent or mitigate future incidents. Analysis is usually performed after detection and before containment, eradication, recovery, and lessons learned. #### **NEW QUESTION # 172**

An administrator notices that several users are logging in from suspicious IP addresses. After speaking with the users, the administrator determines that the employees were not logging in from those IP addresses and resets the affected users' passwords. Which of the following should the administrator implement to prevent this type of attack from succeeding in the future?

- A. Permissions assignment
- B. Access management
- C. Password complexity
- **D. Multifactor authentication**

**Answer: D**

Explanation:

The correct answer is A because multifactor authentication (MFA) is a method of verifying a user's identity by requiring more than one factor, such as something the user knows (e.g., password), something the user has (e.g., token), or something the user is (e.g., biometric). MFA can prevent unauthorized access even if the user's password is compromised, as the attacker would need to provide another factor to log in. The other options are incorrect because they do not address the root cause of the attack, which is weak authentication.

Permissions assignment (B) is the process of granting or denying access to resources based on the user's role or identity. Access management © is the process of controlling who can access what and under what conditions. Password complexity (D) is the requirement of using strong passwords that are hard to guess or crack, but it does not prevent an attacker from using a stolen password.
