

Verified Reliable Observability-Self-Hosted-Fundamentals Exam Bootcamp | Amazing Pass Rate For Observability-Self-Hosted-Fundamentals Exam | Authorized Observability-Self-Hosted-Fundamentals: SolarWinds Observability Self-Hosted Fundamentals

What's more, part of that Pass4Test Observability-Self-Hosted-Fundamentals dumps now are free: https://drive.google.com/open?id=1L-_KtQPNw24gNwqEBLEwAJSyHxthO3D7

Pass4Test is the best choice for those in preparation for exams. Many people have gained good grades after using our Observability-Self-Hosted-Fundamentals exam materials, so you will also enjoy the good results. Our free demo provides you with the free renewal in one year so that you can keep track of the latest points happening in the world. As the questions of our Observability-Self-Hosted-Fundamentals Exam Prep are more or less involved with heated issues and for customers who prepare for the Observability-Self-Hosted-Fundamentals exam.

SolarWinds Observability-Self-Hosted-Fundamentals Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Customization and User Experience: This domain addresses platform customization through dashboards and views, managing user accounts and permissions, implementing custom properties, and organizing resources using groups.
Topic 2	<ul style="list-style-type: none"> Reports: This domain focuses on creating, scheduling, and managing reports that provide insights into network performance, availability, and metrics for documentation and analysis.
Topic 3	<ul style="list-style-type: none"> Node Management: This domain focuses on managing monitored nodes including handling node statuses and working with agents for monitoring and data collection from endpoints.

Test Your Skills with SolarWinds Observability-Self-Hosted-Fundamentals Web-Based Practice Exam Software

if you choose to use the software version of our Observability-Self-Hosted-Fundamentals study guide, you will find that you can download our Observability-Self-Hosted-Fundamentals exam prep on more than one computer and you can practice our

Observability-Self-Hosted-Fundamentals exam questions offline as well. We strongly believe that the software version of our Observability-Self-Hosted-Fundamentals Study Materials will be of great importance for you to prepare for the exam and all of the employees in our company wish you early success!

SolarWinds Observability Self-Hosted Fundamentals Sample Questions (Q22-Q27):

NEW QUESTION # 22

A user indicates when a map is created, only entities can be seen and status is not available. In addition, maps are unable to be nested. What is causing this issue?

- A. user account doesn't have map editing rights
- B. user account doesn't have node management rights
- C. user account doesn't have view edit rights
- D. user account doesn't have administrative rights

Answer: A

Explanation:

SolarWinds Intelligent Maps are highly interactive, but their functionality is strictly gated by user permissions. According to the SolarWinds Platform documentation on Map Management, if a user can see nodes but cannot see their real-time status (the colored status ring) or perform advanced functions like nesting one map inside another, it points to a lack of Map Editing Rights. Without "Map Edit" permissions, the user is essentially in a "restricted view" mode. They can see the physical entities that have been placed on a map, but the dynamic overlays—such as the status of the node or the ability to modify the hierarchy of the map—are disabled to prevent unauthorized changes to the global map configuration. To resolve this, a Platform Administrator must navigate to Settings > All Settings > Manage Accounts, edit the specific user account, and change the "Map Management" or "Allow Map Editing" permission to "Yes". This grants the user the ability to interact with the map's metadata and organizational structure, including nesting and status visualization.

NEW QUESTION # 23

Which two of the following actions can be achieved through the My Deployment page in the web console? (Choose two.)

- A. Activate licenses for installed products.
- B. Set up a SolarWinds platform high availability (HA) pool.
- C. Perform a centralized upgrade of an existing deployment.
- D. Send diagnostics to SolarWinds technical support.

Answer: B,C

Explanation:

The My Deployment page is the centralized administrative hub for managing the health and scale of the SolarWinds Platform. According to the SolarWinds Platform Installation and Upgrade Guide, this page simplifies complex infrastructure tasks that previously required logging into the individual server consoles.

* Centralized Upgrade (B): The "Updates & Evaluations" tab allows administrators to download and orchestrate the upgrade of the main polling engine and all additional polling engines from a single interface. This "Centralized Upgrade" feature ensures all components are updated in the correct order.

* High Availability (HA) Pool Setup (D): The "High Availability" tab provides the wizard-driven interface to create and manage HA pools. This allows you to link a primary server with a standby server to ensure near-zero downtime in the event of a hardware or software failure.

While you can view license status (Option A) or trigger diagnostics (Option C), license activation is typically handled via the License Manager, and diagnostic transmission is often a sub-function of the technical support workflow rather than the primary architectural focus of the "My Deployment" management page.

NEW QUESTION # 24

Which two of the following ways can objects be selected when creating custom reports?

- A. PostgreSQL query

- B. dynamic query builder
- C. static selection
- D. PowerShell script

Answer: B,C

Explanation:

When creating a web-based report in the SolarWinds Platform, the first step is defining the "Selection Method" for the entities you want to include. According to the SolarWinds Platform Reporting Guide, the platform offers two primary user-friendly ways to define the scope of a report:

* Static Selection: This method allows the administrator to manually pick specific nodes, interfaces, or applications from a list. This is best suited for reports targeting a fixed set of infrastructure, such as "Core Data Center Switches".

* Dynamic Query Builder: This is the most powerful method for automated reporting. It allows you to define a set of rules-such as "Vendor is Cisco" and "Department is Finance"-that automatically update the report's content as new devices are added to monitoring that match those criteria.

While advanced users can use SWQL (SolarWinds Query Language) or SQL to define a custom selection, PostgreSQL (Option B) is not used as the backend database for the SolarWinds Platform. Furthermore, while PowerShell (Option C) can be used to extract data via the SolarWinds Information Service (SWIS) API, it is not a selection method used within the native Web-Based Report builder interface.

NEW QUESTION # 25

Which two of the following items are required to use Anomaly-Based Alerts in SolarWinds Hybrid Cloud Observability (HCO)? (Choose two.)

- A. internet connection
- B. AIOps and machine-learning module
- C. advanced machine-learning feature
- D. Platform Connect

Answer: C,D

Explanation:

Anomaly-Based Alerting is a premier feature of Hybrid Cloud Observability that moves beyond static thresholds to identify performance deviations based on historical behavior. According to the SolarWinds HCO Administrator Guide, this feature relies on cloud-assisted analytics to process complex datasets. To enable this, two specific components are required:

* Advanced Machine-Learning Feature: This is the functional logic within the HCO platform that identifies patterns and establishes "normal" baselines for metrics like CPU load or interface utilization.

* Platform Connect: This is the essential bridge that links the self-hosted HCO instance to the SolarWinds cloud-based AIOps engine. Because anomaly detection requires significant computational power to analyze long-term historical trends, the heavy processing is often offloaded. Platform Connect ensures that the necessary metadata can be analyzed securely to generate the dynamic thresholds used for these alerts.

Without Platform Connect, the local server cannot access the machine-learning models required to calculate what constitutes an "anomaly" versus standard operational variance. This architecture allows HCO to provide high-level AIOps capabilities without requiring massive localized hardware for every installation.

NEW QUESTION # 26

A user is building a PerfStack project to troubleshoot an issue with an application. The user is unable to find data for the storage entities that the application accesses beyond application status. Which two of the following reasons explain this discrepancy? (Choose two.)

- A. amount of data to be displayed is too large
- B. product that collects the data is not installed
- C. account limitations restrict the user from accessing storage entities
- D. storage entities may not have data during the specific time period

Answer: B,C

Explanation:

PerfStack is a cross-stack data correlation tool, but its visibility is constrained by the underlying data collection modules and user security settings. According to the PerfStack Troubleshooting Guide, there are two primary reasons why specific entity data (like Storage) would be missing:

* Product Not Installed: Performance data for deep storage metrics (like LUN latency, Array IOPS, or Pool capacity) requires the Storage Resource Monitor (SRM) module or the equivalent HCO storage licensing tiers. If only Server & Application Monitor (SAM) is installed, the user will see the application status, but the specific storage back-end metrics will not be available for selection in the PerfStack pallet because the "collector" for that data doesn't exist.

* Account Limitations: SolarWinds uses Account Limitations to restrict user access to specific parts of the infrastructure. If a user account is limited to "Department = Sales" or "Vendor = Cisco," and the storage entities do not meet those criteria, those entities will be filtered out of the search results in PerfStack. Even if the data exists in the database, the platform security layer prevents the user from "finding" or displaying it to ensure data privacy and multi-tenant security.

NEW QUESTION # 27

.....

About the upcoming Observability-Self-Hosted-Fundamentals exam, do you have mastered the key parts which the exam will test up to now? Everyone is conscious of the importance and only the smart one with smart way can make it. Maybe you are unfamiliar with our Observability-Self-Hosted-Fundamentals Latest Material, but our Observability-Self-Hosted-Fundamentals real questions are applicable to this exam with high passing rate up to 98 percent and over.
