CheckPoint 156-315.81 Exam | 156-315.81 Vce File - Excellent Exam Tool Guaranteed

The services provided by our 156-315.81 test questions are quite specific and comprehensive. First of all, our test material comes from many experts. The gold content of the materials is very high, and the updating speed is fast. By our 156-315.81 exam prep, you can find the most suitable information according to your own learning needs at any time, and make adjustments and perfect them at any time. Our 156-315.81 Learning Materials not only provide you with information, but also for you to develop the most suitable for your learning schedule, this is tailor-made for you, according to the timetable to study and review. I believe you can improve efficiency.

CheckPoint 156-315.81 Exam is intended for security administrators, network engineers, and security consultants who are responsible for managing and maintaining Check Point security solutions in enterprise environments. 156-315.81 exam covers a range of topics, including advanced firewall policies, network segmentation, site-to-site VPNs, remote access VPNs, and advanced troubleshooting techniques. Candidates must have a solid understanding of Check Point's security architecture and be able to apply this knowledge to mitigate security risks.

CheckPoint Check Point Certified Security Expert R81 Sample Questions (Q232-Q237):

NEW QUESTION # 232

GAiA Software update packages can be imported and installed offline in situation where:

- A. The desired CPUSE package is ONLY available in the Check Point CLOUD.
- B. Security Gateway with GAiA does NOT have SSH access to Internet.
- C. Security Gateway with GAiA does NOT have SFTP access to Internet
- **D. Security Gateway with GAiA does NOT have access to Internet.**

Answer: D

NEW QUESTION # 233

Which Check Point software blade provides visibility of users, groups and machines while also providing access control through identity-based policies?

- A. Application Control
- B. Firewall
- C. URL Filtering
- **D. Identity Awareness**

Answer: D

Explanation:

The verified answer is C. Identity Awareness.

Identity Awareness is the Check Point software blade that provides detailed visibility of users, groups, and machines, while also providing application and access control through the creation of accurate, identity-based policies¹. Identity Awareness allows you to easily configure network access and auditing based on three items: network location, the identity of a user and the identity of a machine¹. Identity Awareness integrates with multiple identity sources, such as Microsoft Active Directory, Cisco Identity Services Engine, and RADIUS Accounting^{2,3}.

Application Control is the Check Point software blade that enables network administrators to identify and control thousands of applications and widgets, and millions of websites, based on categories, risk, and characteristics.

Firewall is the Check Point software blade that provides stateful inspection and enforcement of network traffic, and protects against network and application-level attacks.

URL Filtering is the Check Point software blade that enables secure web access by blocking access to malicious and inappropriate websites, and enforcing compliance with corporate policies.

NEW QUESTION # 234

While enabling the Identity Awareness blade the Identity Awareness wizard does not automatically detect the windows domain. Why does it not detect the windows domain?

- A. Identity Awareness is not enabled on Global properties
- B. Security Management Server is not part of the domain
- C. Security Gateway is not part of the Domain
- **D. SmartConsole machine is not part of the domain**

Answer: D

Explanation:

Explanation

The verified answer is B. SmartConsole machine is not part of the domain.

The Identity Awareness wizard uses the SmartConsole machine to detect the windows domain by querying the Active Directory server using DCOM protocol. If the SmartConsole machine is not part of the domain, the query will fail and the wizard will not automatically detect the domain. The user will have to manually enter the domain name and credentials to proceed with the configuration.

The Security Gateway, the Security Management Server, and the Identity Awareness global properties do not affect the domain detection by the wizard. However, they are required for other aspects of the Identity Awareness blade, such as AD Query, Identity Collector, and Browser-Based Authentication2.

NEW QUESTION # 235

After verifying that API Server is not running, how can you start the API Server?

- **A. Run command "api start" in Expert mode**
- B. Run command "mgmt api start" in CLISH mode
- C. Run command "set api start" in CLISH mode
- D. Run command "mgmt__cli set api start" in Expert mode

Answer: A

Explanation:

After verifying that API Server is not running, you can start the API Server by running the command "api start" in Expert mode. This command will start the API Server process (cpm_api) and enable it to run automatically after reboot. You can also use the command "api enable" to enable the API Server without starting it immediately. The other commands are either incorrect or not related to the API Server. The set api command is used in CLISH mode to configure API settings, such as port, domain, or certificate. The mgmt_cli command is used in Expert mode to execute API commands, such as login, logout, show, set, etc.
Reference: [API Server]

NEW QUESTION # 236

What should the admin do in case the Primary Management Server is temporary down?

- A. Run the 'promote_util' to activate the Secondary Management server
- **B. Use the VIP in SmartConsole you always reach the active Management Server.**
- C. The Secondary will take over automatically Change the IP in SmartConsole to logon to the private IP of the Secondary Management Server.

- D. Logon with SmartConsole to the Secondary Management Server and choose 'Make Active' under Actions in the HA Management Menu

Answer: B

Explanation:

Explanation

High Availability (HA) is a deployment scenario where two or more Security Management Servers are configured to work together as a cluster. One server acts as the Primary server and handles all management operations, while another server acts as the Secondary server and serves as a backup. If the Primary server fails, the Secondary server takes over and becomes active. The cluster members communicate using a Virtual IP (VIP) address, which is used by SmartConsole to connect to the active server. If the Primary server is temporarily down, the administrator does not need to do anything, as SmartConsole will automatically connect to the VIP address and reach the Secondary server that has become active. Therefore, the correct answer is A.
