NEW QUESTION # 15

Which programming software task is well-suited for artificial intelligence?

- A. Suggesting code modifications
- B. Adding comments to scripts
- C. Specifying project structure
- D. Performing user testing

Answer: A

Explanation:

Artificial Intelligence, particularly Large Language Models (LLMs) trained on vast repositories of public code, has become exceptionally proficient at suggesting code modifications. This task is well-suited for AI because code is inherently structured and follows strict logical and syntactical rules. AI can analyze a snippet of code, identify inefficiencies, detect potential bugs, and suggest more "pythonic" or optimized ways to achieve the same result. This is often referred to as "AI-assisted development" or "copiloting." While AI can certainly add comments to scripts, that is a relatively low-level task compared to the complex logic involved in code modification. Specifying project structure and performing user testing often require a high-level architectural understanding and human-centric feedback that AI currently lacks in a holistic sense.

Suggesting modifications involves the AI "understanding" the intent of the code and predicting the next logical sequence or identifying a better algorithm to solve a problem. This capability significantly accelerates the development lifecycle, allowing developers to focus on high-level logic while the AI handles boilerplate code and optimization suggestions. It bridges the gap between raw intent and functional implementation by leveraging the statistical likelihood of code patterns found in high-quality software libraries.

NEW QUESTION # 16

A person is using generative AI to create a social media post. Why is it important to write an effective prompt?

- A. The prompt prevents output that is nonsensical.
- B. The prompt indicates how to customize the post for each reader.
- C. The prompt ensures that the content is original.
- D. The prompt ensures that the post will be well received.

Answer: A

Explanation:

Writing an effective prompt is essential because it provides the logical framework the AI needs to process a request; primarily, the prompt prevents output that is nonsensical. Generative AI models are statistical engines that predict the next most likely word or character. Without a clear, well-structured prompt that includes instructions and context, the model can easily lose the "thread" of logic, leading to "hallucinations" or sequences of text that are grammatically correct but logically incoherent or irrelevant to the user's goal.

In the context of social media, where brevity and impact are key, an ineffective prompt might result in a post that uses the wrong hashtags, misses the brand voice, or includes bizarre metaphors that don't make sense to the audience. While no prompt can "ensure" a post will be well-received by humans (Option B) or guarantee absolute originality (Option D), a structured prompt guides the AI to stay within the bounds of human logic.

By providing specific constraints (e.g., "Write a 20-word caption about coffee in a joyful tone"), the user ensures the output is a

sensible, usable piece of content rather than a random string of related words.

NEW QUESTION # 17

A person is preparing for an upcoming speech and wants to use generative AI to help prepare for the speech. What should the person do before writing a prompt?

- A. Identify the goal of the speech
- B. Write a rough draft of the speech
- C. Upload a personal audio sample
- D. Choose a scripting language

Answer: A

Explanation:

The most critical step in the "pre-prompting" phase is the clear identification of the objective. Before interacting with a generative AI, the user must identify the goal of the speech. This foundational step dictates every other element of the prompt, including the persona, tone, and specific constraints. For example, a speech intended to persuade a group of investors requires a radically different linguistic approach than a speech intended to toast a friend at a wedding.

By identifying the goal first, the user can construct a prompt that provides the AI with a clear "definition of success." In practical applications, this is often referred to as the "Intent" phase. If a user skips this and goes straight to writing a draft or providing samples, the AI may generate content that is stylistically correct but fundamentally misses the mark regarding the intended outcome. Clear goals allow the user to evaluate the AI's output critically-checking if the generated text actually serves the purpose of informing, persuading, entertaining, or inspiring. Without a defined goal, prompt engineering becomes a trial-and-error process rather than a strategic exercise.

NEW QUESTION # 18

There have been complaints that deepfake videos on a social media platform are being circulated that show public figures making false statements. Which area of ethical concern does this situation demonstrate?

- A. Regulatory and legal frameworks
- B. Privacy and consent
- C. Bias and representation
- D. Misinformation and manipulation

Answer: D

Explanation:

The rise of deepfakes-AI-generated synthetic media that convincingly depicts people saying or doing things they never did-falls squarely under the ethical concern of Misinformation and manipulation. This represents a significant challenge to the "Information Integrity" of digital platforms. By creating realistic but false content, generative AI can be used to influence elections, damage reputations, or incite social unrest.

This ethical concern highlights the "dual-use" nature of AI. While the same technology can be used for harmless entertainment or high-end film production, in the hands of bad actors, it becomes a tool for "cognitive hacking." Prompt engineering optimization in this context involves developing guardrails within AI models to prevent the generation of content involving public figures or non-consensual imagery. It also involves the use of AI to detect deepfakes by identifying microscopic inconsistencies in pixels or heart-rate signatures that are invisible to the human eye. Addressing misinformation requires a combination of technical watermarking, robust platform policies, and user education to ensure that the boundary between reality and AI-generated fiction remains clear.

NEW QUESTION # 19

A person provides the content of an email to an AI model and asks it to identify whether the email is a promotion. The person prompts the model repeatedly and takes the response most often provided. Which prompting technique is described?

- A. Generated knowledge
- B. Self-consistency
- C. Chain of thought (COT)
- D. Least to most

Answer: B

Explanation:

The technique described is Self-consistency. This is an advanced optimization strategy used to improve the reliability of AI outputs, particularly in classification or reasoning tasks. Because generative AI is probabilistic, it might provide different answers to the same prompt across different sessions. To mitigate the risk of a "one-off" error, the user prompts the model multiple times for the same task and applies a "majority vote" system to select the final answer.

This approach is based on the principle that if multiple different reasoning paths lead to the same conclusion, that conclusion is significantly more likely to be correct. In the case of identifying a promotional email, the model might occasionally misinterpret a professional newsletter as a personal message. However, if it classifies it as a "promotion" in four out of five attempts, the user can be much more confident in that result.

Self-consistency is a critical tool for "de-risking" AI applications in data labeling and sentiment analysis, where high precision is required and the cost of a false positive is high. It leverages the model's internal variance to find the most stable and logically sound output.
