## Juniper Security, Professional (JNCIP-SEC) Sample Questions (Q71-Q76):

NEW QUESTION # 71

You are asked to create multiple virtual routers using a single SRX Series device. You must ensure that each virtual router maintains a unique copy of the routing protocol daemon (RPD) process.

Which solution will accomplish this task?

- A. Tenant system
- B. Transparent mode
- C. Secure wire
- **D. Logical system**

**Answer: D**

Explanation:

Logical systems on SRX Series devices allow the creation of separate virtual routers, each with its unique RPD process. This segmentation ensures that routing and security policies are isolated across different logical systems, effectively acting like independent routers within a single SRX device. For further information, see [Juniper Logical Systems Documentation](#).

To create multiple virtual routers on a single SRX Series device, each with its own unique copy of the routing protocol daemon (RPD) process, you need to use logical systems. Logical systems allow for the segmentation of an SRX device into multiple virtual routers, each with independent configurations, including routing instances, policies, and protocol daemons.

\* Explanation of Answer D (Logical System):

\* A logical system on an SRX device enables you to create multiple virtual instances of the SRX, each operating independently with its own control plane and routing processes. Each logical system gets a separate copy of the RPD process, ensuring complete isolation between virtual routers.

\* This is the correct solution when you need separate routing instances with their own RPD processes on the same physical device.

Configuration Example:

bash

Copy code

```
set logical-systems <logical-system-name> interfaces ge-0/0/0 unit 0
```

```
set logical-systems <logical-system-name> routing-options static route 0.0.0.0/0 next-hop 192.168.1.1 Juniper Security Reference:
```

\* Logical Systems Overview: Logical systems allow for the creation of multiple virtual instances within a single SRX device, each with its own configuration and control plane. Reference: [Juniper Logical Systems Documentation](#).

## NEW QUESTION # 72

What is the purpose of the Switch Microservice of Policy Enforcer?

- **A. to isolate infected hosts**
- B. to inspect traffic for malware
- C. to enroll SRX Series devices with Juniper ATP Cloud
- D. to synchronize security policies to SRX Series devices

**Answer: A**

## NEW QUESTION # 73

Exhibit

Interface	Member-ID	Type	Status	Tx	Rx	CAK Name
ge-0/0/1	E752CAEAE8DDFB82D4EA4BF7		preceding	live	8888	
	8951				8888	
ge-0/0/1	0F2D5171F38EAB16C2E0CB62		fallback	active	8959	
	8952				FFFF	
ge-0/0/1	6B49BD5CF7188F3CD9A29D30		primary	in-progress	2439	
	XXXX					

Referring to the exhibit, which two statements are true about the CAK status for the CAK named "FFFF"? (Choose two.)

- **A. CAK is used for encryption and decryption of the MACsec session.**
- B. SAK is successfully generated using this key.
- C. CAK is not used for encryption and decryption of the MACsec session.
- **D. SAK is not generated using this key.**

**Answer: A,D**

#### NEW QUESTION # 74

Your Source NAT implementation uses an address pool that contains multiple IPv4 addresses. Your users report that when they establish more than one session with an external application, they are prompted to authenticate multiple times. External hosts must not be able to establish sessions with internal network hosts. What will solve this problem?

- A. Disable PAT.
- B. Enable address persistence.
- C. Enable persistent NAT.
- D. Enable destination NAT.

**Answer: C**

#### NEW QUESTION # 75

How does an SRX Series device examine exception traffic?

- A. The device examines the host-outbound traffic for the egress interface and zone.
- B. The device examines the host-inbound traffic for the egress interface and zone.
- C. The device examines the host-inbound traffic for the ingress interface and zone.
- D. The device examines the host-outbound traffic for the ingress interface and zone.

**Answer: C**

Explanation:

Exception traffic, including management and control plane traffic, is handled by examining host-inbound traffic configurations at the ingress interface and zone. It ensures traffic reaches necessary services like SSH and IKE securely. See Juniper Host Inbound Traffic Documentation for more.

SRX Series devices handle exception traffic (such as management traffic like SSH, Telnet, DNS queries, etc.) differently than regular transit traffic. Exception traffic is examined based on host-inbound traffic for the ingress interface and zone. If traffic is destined for the device itself (e.g., management traffic or routing protocol messages), it must be allowed as host-inbound traffic on both the ingress interface and zone.

Example Command:

```
bash
```

```
set security zones security-zone trust host-inbound-traffic system-services ssh
```

This ensures that traffic destined to the SRX device is inspected based on the ingress interface and zone.
