Reliable Plat-Dev-301 Test Prep | Test Plat-Dev-301 Questions Fee

With Plat-Dev-301 study engine, you will get rid of the dilemma that you work hard but cannot improve. With our Plat-Dev-301 learning materials, you can spend less time but learn more knowledge than others. Plat-Dev-301 exam questions will help you reach the peak of your career. Just think of that after you get the Salesforce Certified Platform Developer II - Multiple Choice Plat-Dev-301 Certification, you will have a lot of opportunities of going to bigger and better company and getting higher incomes!

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q122-Q127):

NEW QUESTION # 122

A developer needs to implement a historical Task reporting feature that allows users, assigned to a custom profile named "Auditors", to perform searches against the Tasks related to the Account object.

The developer must ensure the search is able to return Tasks that are between 12 and 24 months old. It should exclude any tasks which have been deleted, and include Tasks whether archived or not.

Given the following code, which select statement should be inserted at the placeholder as a valid way to retrieve the Tasks ranging from L2 to 24 months old?

- A)
- B)
- C)
- D)

- A. Option D
- B. Option B
- C. Option C
- D. Option A

Answer: C

Explanation:

To retrieve Tasks that are between 12 and 24 months old, we need to use a SOQL query that filters based on the CreatedDate. The query must exclude deleted records and include both active and archived tasks. Since Tasks can be archived after a certain period (typically 12 months), we must ensure the query includes these as well.

Option C is correct because it uses ALL ROWS in the SOQL query, which includes both active and archived (soft-deleted) records. The query also correctly uses a range for CreatedDate to ensure it selects Tasks created between 12 to 24 months ago. Option A is incorrect because it does not include the ALL ROWS keyword, which is necessary to include archived Tasks in the results.

Option B is incorrect because it only retrieves Tasks created in the last 12 months, not between 12 to 24 months ago.

Option D is incorrect because it does not filter Tasks based on their creation date correctly to include only those that are between 12 and 24 months old.

NEW QUESTION # 123

A developer is trying to access org data from within a test class.

Which sObject type requires the test class to have the (seeAllData=true) annotation?

- A. RecordType
- B. Profile
- C. User
- D. Report

Answer: D

Explanation:

NEW QUESTION # 124

Universal Containers analyzes a Lightning web component and its Apex controller class that retrieves a list of contacts associated with an account. The code snippets are as follows:

Based on the code snippets, what change should be made to display the contacts' mailing addresses in the Lightning web component?

- A. Modify the SOQL query in the getAccountContacts method to include the MailingAddress field.
- B. **Modify the SOQL query in the getAccountContacts method to include the MailingAddress field and update the columns attribute in javascript file to add Mailing address fields.**
- C. Extend the lightning-datable component in the Lightning web component to include a column for the MailingAddress field.
- D. Add a new method in the Apex controller class to retrieve the mailing addresses separately and modify the Lightning web component to invoke this method.

Answer: B

Explanation:

To display the contacts' mailing addresses in the Lightning web component, both the SOQL query in the `getAccountContacts` method and the `columns` attribute in the JavaScript file of the component need to be updated. The query must include the `MailingAddress` field, and the JavaScript file must be modified to add this field to the `columns` shown in the lightning-datatable.

NEW QUESTION # 125

A company has a web page that needs to get Account record information, such as name, website, and employee number. The Salesforce record ID is known to the web page and it uses JavaScript to retrieve the account information. Which method of integration is optimal?

- A. SOAP API
- B. Apex SOAP web service
- C. Apex REST web service
- D. REST API

Answer: D

Explanation:

For retrieving specific records using a known ID, the REST API is optimal due to its stateless, cacheable communications and lightweight structure. It's ideal for web applications that use JavaScript to make requests directly from the user's browser. Using the REST API, the web page can make a simple HTTP GET request to the Salesforce REST service endpoint and retrieve the account information in a format that's easily handled by JavaScript (typically JSON).

NEW QUESTION # 126

A developer notices the execution of all the test methods in a class takes a long time to run, due to the initial setup of all the test data that is needed to perform the tests. What should the developer do to speed up test execution?

- A. Reduce the amount of test methods in the class.
- B. Define a method that creates test data and annotate with `@testSetup`.
- C. Define a method that creates test data and annotate with `@createData`.
- D. Ensure proper usage of test data factory in all test methods.

Answer: B

Explanation:

Using the `@testSetup` annotation to define a method that creates test data before the tests run can significantly speed up test execution by reducing the setup time for each test method in the class. This method runs once before any test method in the class and can be used by all test methods.

NEW QUESTION # 127
