Fortinet FCP_FWB_AD-7.4 시험요강:

주제	소개
주제 1	Machine Learning (ML): This section tests the skills of Application Security Engineers in leveraging machine learning to enhance web application security. Candidates will configure machine learning algorithms to detect anomalies, mitigate bot-based threats, and secure APIs through AI-driven analysis. Understanding how to fine-tune these ML-based security measures is crucial for ensuring robust application protection against evolving cyber threats.
주제 2	Deployment and Configuration: This section of the exam measures the skills of Network Security Engineers and covers the ability to identify FortiWeb deployment requirements and configure essential system settings. Candidates are expected to set up server pools, security policies, and protected hostnames to ensure seamless deployment. To maintain operational efficiency, they must also configure FortiWeb high availability (HA) for fault tolerance and troubleshoot deployment or system-related issues.
주제 3	Web Application Security: This domain evaluates the ability of Cybersecurity Specialists to implement advanced threat mitigation strategies using FortiWeb. Candidates must configure the system to block known attacks, ensure comprehensive web application protection, and troubleshoot threat detection or mitigation-related issues. Additionally, they are expected to set up API protection mechanisms to secure web-based interactions from potential threats.
주제 4	Encryption, Authentication, and Compliance: This section of the exam assesses the expertise of Security Analysts in mitigating web application vulnerabilities through encryption and authentication mechanisms. Candidates must configure various access control methods, track user authentication, and prevent attacks targeting authentication systems. They must also implement SSL inspection and offloading techniques to enhance security and troubleshoot encryption or authentication-related issues effectively.

최신 Public Cloud Security FCP_FWB_AD-7.4 무료 샘플 문제 (Q37-Q42):

질문 # 37

Which Layer 7 routing method does FortiWeb support?

- A. OSPF
- B. BGP
- C. URL policy routing
- D. HTTP content routing

정답: D

설명:

FortiWeb is a Web Application Firewall (WAF) designed to protect web applications from various threats. Among its features, FortiWeb supports Layer 7 routing methods, which operate based on the content of the HTTP/HTTPS traffic. HTTP Content Routing refers to the capability of directing incoming web traffic to specific backend servers based on characteristics found within the HTTP requests, such as URL paths, headers, or other content. This allows for more granular and efficient distribution of traffic, ensuring that requests are handled by the appropriate servers based on their content.

Analysis of Options:

A . URL policy routing: While this term suggests routing decisions based on URL policies, it is not a standard term used in FortiWeb's documentation. FortiWeb's content routing encompasses URL-based decisions, making this option less precise.
B . OSPF (Open Shortest Path First): This is a Layer 3 routing protocol used for IP routing within an Autonomous System. It operates at the network layer and is not related to Layer 7 routing methods.
C . BGP (Border Gateway Protocol): Another Layer 3 routing protocol, BGP is used for routing between Autonomous Systems on the internet. It does not pertain to Layer 7 or application-layer routing.
D . HTTP content routing: This aligns with FortiWeb's capabilities to make routing decisions based on the content of HTTP requests, such as URL paths, headers, or other application-layer data. This is a Layer 7 routing method supported by FortiWeb. Therefore, the correct answer is D. HTTP content routing.
