Fortinet NSE 5 - FortiSASE and SD-WAN 7.6 Core Administrator Sample Questions (Q37-Q42):

NEW QUESTION # 37

Refer to the exhibit. How does FortiGate handle the traffic with the source IP 10.0.1.130 and the destination IP 128.66.0.125?

```
branch1_fgt # show router policy
config router policy
  edit 1
    set src "10.0.1.128/255.255.255.128"
    set dst "128.66.0.0/255.255.255.0"
    set action deny
  next
end

- A. FortiGate routes the traffic flow according to the FIB.
- B. FortiGate drops the traffic flow.
- C. FortiGate steers the traffic flow through port2.
- D. FortiGate load balances the traffic flow through port1 and port2.

Answer: A

Explanation:

On FortiGate, a policy route (PBR) with action deny does not drop the traffic outright. Instead, it prevents the traffic from being steered by that policy route, and the packet is then handed back to the regular routing lookup (FIB):

Source 10.0.1.130 matches 10.0.1.128/25

Destination 128.66.0.125 matches 128.66.0.0/24

Router policy says action deny → do not use this policy route

Result: FortiGate falls back to the FIB (normal routing table).

NEW QUESTION # 38

Which three reports are valid report types in FortiSASE? (Choose three.)

- A. Shadow IT Report
- B. Vulnerability Assessment Report
- C. Endpoint Compliance Deviation Report

- D. Cyber Threat Assessment
- E. Web Usage Summary Report

Answer: A,B,E

Explanation:

Shadow IT Report: Leveraging the built-in CASB (Cloud Access Security Broker) capabilities, this report identifies "unsanctioned" or "risky" SaaS applications being used by employees. It helps organizations discover hidden security risks by cataloging cloud applications that have not been explicitly approved by the IT department.

Vulnerability Assessment Report: Since FortiSASE integrates with FortiClient and an embedded EMS, it can aggregate vulnerability scan data from managed endpoints. This report lists software vulnerabilities found on user devices (OS-level and application-level), providing a "Security Rating" or posture assessment that is critical for Zero Trust Network Access (ZTNA) enforcement.

Web Usage Summary Report: This report provides a high-level overview of web activity across the SASE deployment. It categorizes traffic by website categories (e.g., Social Media, Streaming, Malicious Sites), top users by bandwidth, and blocked requests, helping IT teams understand how internet resources are being consumed by remote workers.

NEW QUESTION # 39

Refer to the exhibits. Two SD-WAN event logs, the member status, the SD-WAN rule configuration, and the health-check configuration for a FortiGate device are shown.

Immediately after the log messages are displayed, how will the FortiGate steer the traffic based on the information shown in the exhibits? (Choose one answer)

The screenshot displays four panels from the FortiGate GUI:

- SD-WAN event logs (left):** Shows a log entry for "SDWAN status" with Log ID 0113022923. The message is "Member status changed. Member out-of-sla." for Member 1.
- SD-WAN rule configuration (top middle):** Shows configuration for rule ID 1, named "Critical-DIA", in "sla" mode. It has two members: member 1 2 and member 1 2.
- SD-WAN health-check configuration (bottom middle):** Shows configuration for "Corp_HC" health check. It has two servers: "198.18.1.1" and "198.18.1.2". Thresholds are: latency-threshold 150, jitter-threshold 50, and packetloss-threshold 5.
- SD-WAN event logs (right):** Shows a log entry for "SDWAN status" with Log ID 0113022923. The message is "Number of pass member changed." with a new value of 1 and an old value of 2.

- A. FortiGate uses port2 to steer the traffic for SD-WAN rule ID 1.
- B. FortiGate uses port1 to steer the traffic for SD-WAN rule ID 1.
- C. FortiGate uses port1 or port2 to steer the traffic for SD-WAN rule ID 1.
- D. FortiGate skips SD-WAN rule ID 1.

Answer: A

Explanation:

According to the SD-WAN 7.6 Core Administrator curriculum and the provided exhibits, the traffic steering decision is determined by the interaction between the Lowest Cost (SLA) strategy and the link health status reported in the event logs.

Rule Strategy (Lowest Cost SLA): The SD-WAN rule configuration for ID 1 (named Critical-DIA) is set to mode sla. In this mode, the FortiGate will only steer traffic through member interfaces that satisfy the assigned Performance SLA targets.

Member Preference: The rule defines priority-members 1 2. This means that under normal conditions (where both links are healthy), Member 1 (port1) is the preferred interface because it is listed first.

Event Log Analysis:

The first log message explicitly states: "Member status changed. Member out-of-sla." for Member

1. This indicates that port1 has exceeded one of the thresholds (latency, jitter, or packet loss) defined in the Corp_HC health check.

The second log confirms: "Number of pass member changed. New Value: 1, Old Value: 2". This verifies that while there were previously two links passing the SLA, now only one link (Member

2/port2) remains in a passing state.

Steering Decision: Because the rule strategy is mode sla and the primary preferred member (port1) is now out-of-sla, the FortiGate immediately disqualifies Member 1 from the selection pool for this specific rule. It then moves to the next available member in the priority list that does satisfy the SLA, which is Member 2 (port2).

NEW QUESTION # 40

Which FortiSASE feature monitors SaaS application performance and connectivity to points of presence (POPs)?

- A. Digital experience monitoring
- B. FortiView dashboards
- C. Event logs
- D. Operations widgets

Answer: A

NEW QUESTION # 41

What are three key routing principles of SD-WAN? (Choose three.)

- A. SD-WAN members are skipped if they do not have a valid route to the destination.
- B. Directly connected routes have precedence over SD-WAN rules.
- C. Policy routes have precedence over SD-WAN rules.
- D. SD-WAN rules are skipped if the best route to the destination is not an SD-WAN member.
- E. SD-WAN rules are skipped if the best route to the destination is a static route.

Answer: A,C,D

Explanation:

An SD-WAN member is used only if it has a valid route to the destination; otherwise it is skipped.

If the best route to the destination does not use an SD-WAN member, SD-WAN rules are skipped.

Policy routes always take precedence over SD-WAN rules, following FortiGate's routing hierarchy.
