Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q21-Q26):

NEW QUESTION # 21

The site you are managing has a "Comments approval" process. You have moderators with appropriate permissions to review and approve comments. The moderators want to see all the unapproved comments sorted by the node on which they are posted, but they can't do this on the Comments approval page.

What is the simplest way to solve this problem?

- A. Create a View of unapproved comments and set the sort order to "Entity ID."
- B. Have the content editor review comments by visiting the node instead of using the Comments page.
- C. Create an Export view, so the content editor can review comments in a spreadsheet.
- D. Edit the Comments View, and update the table settings to make the Entity ID field sortable.

Answer: D

Explanation:

In Drupal 10 and Drupal 11, the administrative Comments listing is provided by the core comment View. In core's default `views.view.comment` configuration, the comments administration display uses the table style, includes the `entity_id` field labeled "Posted in", and that column is present in the table configuration.

However, core sets that column's table option to `sortable: false`, while other columns such as Subject, Author, and Updated are sortable. That is why moderators cannot sort the approval page by the content item the comment belongs to, even though the field is already there.

Because the existing approval page already uses a View, the simplest solution is to edit that View and enable sorting for the Entity ID / Posted in column in the table settings. Creating a brand-new View would work, but it is not the simplest option because it duplicates an existing administrative display. The other options do not address the actual issue with the current moderation screen. Drupal's content administration documentation also confirms that comments are managed from the Comments administration page, making improvement of that interface the most appropriate site-building solution.

NEW QUESTION # 22

A new customer has asked, why a Drupal-based website will be more flexible over a custom developed website. Which THREE Drupal features would you explain to the customer?

- **A. Drupal has a comprehensive and feature rich administrative UI out of the box.**
- B. Drupal allows you to directly rename database columns from the UI.
- **C. Drupal can be used as a headless CMS out of the box.**
- D. Drupal.org has an online store where you can purchase modules and themes.
- **E. Drupal provides comprehensive content modeling and listing of content using UI.**

Answer: A,C,E

Explanation:

Drupal 10 and Drupal 11 are flexible because they provide major site-building capabilities through configuration and core modules, instead of requiring everything to be custom-coded. Drupal supports headless /decoupled use cases out of the box through core web services such as JSON:API, which Drupal documentation describes as a standard way to expose site content for decoupled applications. That makes A correct.

Drupal also provides strong content modeling through entity types and fields, and it supports listing and displaying content through the Views UI. The User Guide and core documentation explain that site builders can define structured content types and then create listings, pages, blocks, sorting, and filtering through Views without writing custom code. That makes B correct.

Drupal additionally ships with a rich administrative interface for installing modules, managing themes, creating content types, editing fields, configuring permissions, and administering content. This is one of the platform's core strengths compared with a purely custom-built system, so E is correct.

Options C and D are not correct. Drupal.org provides contributed projects, but not an online store for buying modules and themes, and Drupal does not present direct database-column renaming as a normal UI-based site-building feature.

NEW QUESTION # 23

You manage a popular news portal which has a very busy comments section. You've been asked to add several new fields and a View for the news area of a site. The QA team wants to review your work in staging before rolling everything out to production at once. The editorial team has specified that the site's comments activity should not be affected by these changes.

How can you meet these requirements without having to create the new functionality independently in both environments?

- A. Configuration created in the staging environment is automatically available to the production environment since they share a database.
- B. Copy the production database into the staging environment. Create the fields and View there. Once QA is satisfied, copy the staging database into the production environment.
- C. Create the fields and View in a fresh installation of Drupal core. Export the site configuration into your site's existing codebase, push the code to the staging environment, and import the site configuration there. Once QA is satisfied, repeat the process in production.
- **D. Create the fields and View in a development copy of the site. Export the site configuration to code. Push that code to the staging environment and import the site configuration there. Once QA is satisfied, repeat the process in production.**

Answer: D

Explanation:

Drupal's configuration management system is specifically designed to move site configuration -such as content types, fields, vocabularies, and Views-between environments by exporting configuration to files and then importing it elsewhere. Drupal documentation explicitly describes configuration as the administrative settings that determine how the site functions, and it lists fields and views as examples of configuration.

That makes option D the correct workflow: build the new fields and View on a development copy of the site, export the configuration to code, deploy that code to staging, import it for QA review, and then repeat the import in production after approval. This preserves live editorial activity such as comments , because comments are site content , not configuration, and configuration deployment avoids overwriting production content with a copied database.

Option A is risky because copying the staging database back to production could overwrite live comments and other newly created production content. Option B is false because staging and production do not automatically share configuration through one database in a normal deployment workflow. Option C is inferior because configuration should be created from a development copy of the actual site, where the existing modules, schema, and site setup already match the target environments.

NEW QUESTION # 24

What is meant by headless Drupal?

(Select 2 options)

- A. Exposing Drupal content to other systems such as native applications.
- B. Publishing content automatically in Drupal
- C. Applying security updates automatically to Drupal installation
- D. Just another phrase for "decoupled Drupal"

Answer: A,D

Explanation:

In Drupal's official documentation, headless Drupal is described as decoupled Drupal . The documentation explains that decoupled, or headless, Drupal separates the backend content management part of Drupal from the frontend presentation layer . In this architecture, Drupal is used as a content repository and content API, while the frontend can be built with other technologies such as JavaScript frameworks or consumed by other clients. This directly supports option C Drupal documentation also explains that this architecture allows Drupal content to be exposed to other systems and applications through APIs such as JSON:API or REST. That means Drupal can provide content to websites, mobile apps, kiosks, or other digital channels, which matches option B . The purpose of headless Drupal is therefore not automatic updates or automatic publishing, so options A and D are not correct. So, according to Drupal 10 and Drupal 11 documentation, the correct understanding is that headless Drupal means decoupled Drupal and involves exposing Drupal-managed content to external systems or applications through APIs .

NEW QUESTION # 25

You have a Corporate site where all traffic is anonymous. On the site, you have been getting thousands of user registrations every day. You notice that most of the registrations are spam.

What will you do to prevent this?

- A. Set the personal contact form for new users to disabled, and set email verification to use the personal contact form method.
- B. Set "Who can register accounts" to "Visitors," and check "Enable password strength indicator."
- C. Set "Who can register accounts" to "Administrators only," and assign the task of new account creation to site admins.
- D. Add user/password in your .htaccess, so that only people who know the credentials can access your site and create an account.

Answer: C

Explanation:

For a corporate site where public visitors do not need self-service accounts, the correct Drupal site-building solution is to disable visitor registration. Drupal's official User Guide for Configuring User Account Settings says to go to Configuration > People > Account settings and, under Registration and cancellation , select

"Administrators only" as the people with permission to register user accounts. This turns off public account creation and is the standard Drupal method for stopping spam registrations on sites that do not need open sign- up.

The other choices do not match Drupal's documented account-management approach. Option B still allows visitors to create accounts, so it does not prevent spam registrations; a password strength indicator is unrelated to blocking bot sign-ups. Option A would protect the entire site at the web-server level, which is not the intended Drupal account-registration setting and would block

all anonymous access, contradicting the site's normal public use. Option D refers to unrelated contact-form behavior and does not control account creation.

Drupal's account settings documentation specifically identifies "Administrators only" as the way to stop visitor registration, making C the verified answer.

NEW QUESTION # 26

.....

Practicing under these situations helps to kill Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) exam anxiety. Questions in desktop-based mock exams are identical to the real ones. Our practice exams give you options to change their durations and questions' numbers to polish your skills. You can easily assess your readiness with the assistance of results produced by the practice exam.
