

Pass Leader SOA-C03 Dumps, SOA-C03 Test Score Report

QUESTION 1

A company has a website hosted on AWS. The website is behind an Application Load Balancer (ALB) that is configured to handle HTTP and HTTPS separately. The company wants to forward all requests to the website so that the requests will use HTTPS. What should a solutions architect do to meet this requirement?

- A. Update the ALB's network ACL to accept only HTTPS traffic.
- B. Create a rule that replaces the HTTP in the URL with HTTPS.
- C. Create a listener rule on the ALB to redirect HTTP traffic to HTTPS.
- D. Replace the ALB with a Network Load Balancer configured to use Server Name Indication (SNI).

Answer: C

Explanation:

<https://aws.amazon.com/premiumsupport/knowledge-center/elb-redirect-http-to-https-using-alb/>

QUESTION 2

A company is developing a two-tier web application on AWS. The company's developers have deployed the application on an Amazon EC2 instance that connects directly to a backend Amazon RDS database. The company must not hardcode database credentials in the application. The company must also implement a solution to automatically rotate the database credentials on a regular basis.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Store the database credentials in the instance metadata. Use Amazon EventBridge (Amazon CloudWatch Events) rules to run a scheduled AWS Lambda function that updates the RDS credentials and instance metadata at the same time.
- B. Store the database credentials in a configuration file in an encrypted Amazon S3 bucket. Use Amazon EventBridge (Amazon CloudWatch Events) rules to run a scheduled AWS Lambda function that updates the RDS credentials and the credentials in the configuration file at the same time. Use S3 Versioning to ensure the ability to fall back to previous values.
- C. Store the database credentials as a secret in AWS Secrets Manager. Turn on automatic rotation for the secret. Attach the required permission to the EC2 role to grant access to the secret.
- D. Store the database credentials as encrypted parameters in AWS Systems Manager Parameter Store. Turn on automatic rotation for the encrypted parameters. Attach the required permission to the EC2 role to grant access to the encrypted parameters.

Answer: C

QUESTION 3

A company is deploying a new public web application to AWS. The application will run behind an Application Load Balancer (ALB). The application needs to be encrypted at the edge with an SSL/TLS certificate that is issued by an external certificate authority (CA). The certificate must be rotated each year before the certificate expires.

What should a solutions architect do to meet these requirements?

- A. Use AWS Certificate Manager (ACM) to issue an SSL/TLS certificate.

DOWNLOAD the newest ValidTorrent SOA-C03 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1XYnD3QzjAc7-u8tpBBRDC6aVhwVKZ79N>

Our SOA-C03 exam materials are compiled by experts and approved by the professionals who are experienced. They are revised and updated according to the pass exam papers and the popular trend in the industry. The language of our SOA-C03 exam torrent is simple to be understood and our SOA-C03 test questions are suitable for any learners. Only 20-30 hours are needed for you to learn and prepare our SOA-C03 Test Questions for the exam and you will save your time and energy. No matter you are the students or the in-service staff you are busy in your school learning, your jobs or other important things and can't spare much time to learn.

Our website provides the most up-to-date and accurate SOA-C03 dumps torrent which are the best for passing certification test. It will help you to accelerate your knowledge and improve your professional ability by using our SOA-C03 VCE Dumps. We are so proud of helping our candidates go through SOA-C03 real exam in their first attempt quickly. The pass rate of our products increased last year because of its reliability.

SOA-C03 Test Score Report - Best SOA-C03 Practice

There are a lot of leading experts and professors in different field in our company. The first duty of these leading experts and professors is to compile the SOA-C03 exam questions. In order to meet the needs of all customers, the team of the experts in our company has done the research of the SOA-C03 study materials in the past years. As a result, they have gained an in-depth

understanding of the fundamental elements that combine to produce world class SOA-C03 practice materials for all customers.

Amazon AWS Certified CloudOps Engineer - Associate Sample Questions (Q66-Q71):

NEW QUESTION # 66

A CloudOps engineer wants to share a copy of a production database with a migration account.

The production database is hosted on an Amazon RDS DB instance and is encrypted at rest with an AWS Key Management Service (AWS KMS) key that has an alias of production-rds-key.

What must the CloudOps engineer do to meet these requirements with the LEAST administrative overhead?

- A. Take a snapshot of the RDS DB instance in the production account. Share the snapshot with the migration account. In the migration account, create a new KMS key that has an identical alias.
- B. Use native database toolsets to export the RDS DB instance to Amazon S3. Create an S3 bucket and an S3 bucket policy for cross-account access between the production account and the migration account. Use native database toolsets to import the database from Amazon S3 to a new RDS DB instance.
- C. Take a snapshot of the RDS DB instance in the production account. Amend the KMS key policy of the production-rds-key KMS key to give access to the migration account's root user. Share the snapshot with the migration account.
- D. Create an RDS read replica in the migration account. Configure the KMS key policy to replicate the production-rds-key KMS key to the migration account.

Answer: C

Explanation:

Encrypted RDS snapshots can be shared across accounts only if the KMS key that encrypts them allows the target account to use the key. The CloudOps engineer should (1) take a snapshot of the encrypted RDS instance, (2) update the production-rds-key KMS key policy to grant the migration account access, and then (3) share the snapshot with the migration account. This is the simplest, fully managed approach with the least administrative overhead.

NEW QUESTION # 67

A company runs an application on a large fleet of Amazon EC2 instances to process financial transactions. The EC2 instances share data by using an Amazon Elastic File System (Amazon EFS) file system.

The company wants to deploy the application to a new Availability Zone and has created new subnets and a mount target in the new Availability Zone. When a SysOps administrator launches new EC2 instances in the new subnets, the EC2 instances are unable to mount the file system.

What is a reason for this issue?

- A. The security group for the mount target does not allow inbound NFS connections from the security group used by the EC2 instances.
- B. The route tables have not been configured to route traffic to a VPC endpoint for Amazon EFS in the new Availability Zone.
- C. The EFS mount target has been created in a private subnet.
- D. The IAM role that is associated with the EC2 instances does not allow the `efs:MountFileSystem` action.

Answer: A

Explanation:

When you add a new EFS mount target in a new Availability Zone, that mount target has its own security group. For the EC2 instances in that AZ to mount the file system over NFS, the mount target's security group must allow inbound TCP 2049 (NFS) from the EC2 instances' security group.

If that rule isn't there, the instances can see the mount target in the same VPC/AZ but can't complete the NFS connection, so the mount fails.

NEW QUESTION # 68

A company is using AWS CloudTrail and wants to ensure that SysOps administrators can easily verify that the log files have not been deleted or changed.

Which action should a SysOps administrator take to meet this requirement?

- A. Enable CloudTrail log file integrity validation when the trail is created or updated.
- B. Configure the S3 bucket to replicate the log files to another bucket.
- C. Grant administrators access to the AWS Key Management Service (AWS KMS) key used to encrypt the log files.
- D. Turn on Amazon S3 server access logging for the bucket storing the log files.

Answer: A

Explanation:

CloudTrail can produce digest files and sign log files to detect tampering. Enabling log file integrity validation ensures that any modification or deletion of delivered log files can be detected by verification against the digests and signatures, providing verifiable evidence of tampering or non-tampering for each log file. This is the standard mechanism used to assure SysOps that logs have not been altered after delivery.

NEW QUESTION # 69

A CloudOps engineer wants to provide access to AWS services by attaching an IAM policy to multiple IAM users. The CloudOps engineer also wants to be able to change the policy and create new versions.

Which combination of actions will meet these requirements? (Choose two.)

- A. Add the users to an IAM user group. Attach the policy to the group.
- B. Add the users to an IAM service-linked role. Attach the policy to the role.
- C. Create an inline policy.
- D. Create a customer managed policy.
- E. Create an AWS managed policy.

Answer: A,D

Explanation:

Attaching a policy to a group allows centralized management of permissions for multiple users. All users in the group automatically inherit the policy permissions.

A customer managed policy is reusable, versioned, and editable. You can create new versions of the policy and update or roll back as needed. Combining this with a user group provides flexible, scalable, and maintainable permission management.

NEW QUESTION # 70

A company runs an application that logs user data to an Amazon CloudWatch Logs log group. The company discovers that personal information the application has logged is visible in plain text in the CloudWatch logs.

The company needs a solution to redact personal information in the logs by default. Unredacted information must be available only to the company's security team. Which solution will meet these requirements?

- A. Create an OpenSearch domain. Create an AWS Glue workflow that runs a Detect PII transform job and streams the output to the OpenSearch domain. Configure the CloudWatch log group to stream the logs to AWS Glue. Modify the OpenSearch domain access policy to allow only the security team to access the domain.
- B. Create an Amazon S3 bucket. Create an export task from appropriate log groups in CloudWatch. Export the logs to the S3 bucket. Configure an Amazon Macie scan to discover personal data in the S3 bucket. Invoke an AWS Lambda function to move identified personal data to a second S3 bucket. Update the S3 bucket policies to grant only the security team access to both buckets.
- C. Create a customer managed AWS KMS key. Configure the KMS key policy to allow only the security team to perform decrypt operations. Associate the KMS key with the application log group.
- D. Create an Amazon CloudWatch data protection policy for the application log group. Configure data identifiers for the types of personal information that the application logs. Ensure that the security team has permission to call the unmask API operation on the application log group.

Answer: D

Explanation:

CloudWatch Logs data protection provides native redaction/masking of sensitive data at ingestion and query. AWS documentation states it can "detect and protect sensitive data in logs" using data identifiers, and that authorized users can "use the unmask action to view the original data." Creating a data protection policy on the log group masks PII by default for all viewers, satisfying the requirement to redact personal information. Granting only the security team permission to invoke the unmask API operation ensures that unredacted content is restricted. Option B (KMS) encrypts at rest but does not redact fields; encryption alone does not prevent

plaintext visibility to authorized readers. Options A and D add complexity and latency, move data out of CloudWatch, and do not provide default inline redaction/unmask controls in CloudWatch itself. Therefore, the CloudOps-aligned, managed solution is to use CloudWatch Logs data protection with appropriate data identifiers and unmask permissions limited to the security team.

References (AWS CloudOps Documents / Study Guide):
