Many candidates find the Microsoft GH-900 exam preparation difficult. They often buy expensive study courses to start their Microsoft GH-900 certification exam preparation. However, spending a huge amount on such resources is difficult for many GitHub Foundations exam applicants. The latest Microsoft GH-900 ExamDumps are the right option for you to prepare for the Microsoft GH-900 certification test at home.

As is known to us, the quality is an essential standard for a lot of people consuming movements, and the high quality of the GH-900 study materials is always reflected in the efficiency. We are glad to tell you that the GH-900 study materials from our company have a high quality and efficiency. If you decide to choose our study materials as you first study tool, it will be very possible for you to pass the GH-900 Exam successfully, and then you will get the related certification in a short time.

Download GH-900 Demo - Latest GH-900 Exam Pass4sure

There are totally three versions of GH-900 practice materials which are the most suitable versions for you: PDF, software and app versions. We promise ourselves and exam candidates to make these GH-900 preparation prep top notch. So if you are in a dark space, our GH-900 Study Guide can inspire you make great improvements. With the high pass rate of our GH-900 learning engine as 98% to 100%, you can be confident and ready to pass the exam easily.

Microsoft GH-900 Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> • Project Management: This section is designed for Project Coordinators and Product Managers and focuses on using GitHub Projects for project management. Candidates learn to create and manage GitHub Projects, utilize project boards for organizing tasks, and integrate project workflows with issues and pull requests to maintain project visibility and progress.
Topic 2	<ul style="list-style-type: none"> • Modern Development: This domain assesses abilities of DevOps Engineers and Continuous Integration Specialists in implementing modern development practices. It emphasizes understanding DevOps principles and leveraging GitHub Actions for automation and CI • CD pipeline implementation. Candidates also learn GitHub's tools and best practices for conducting and managing code reviews.
Topic 3	<ul style="list-style-type: none"> • Collaboration Features: This section measures skills of Software Engineers and Team Leads and covers collaborative workflows using GitHub. It includes forking repositories, creating and managing pull requests, reviewing and merging code changes, and using GitHub Actions to support CI • CD pipelines. Candidates also explore project management features such as creating and managing issues, using labels, milestones, and project boards, and tracking progress through GitHub Projects.

Microsoft GitHub Foundations Sample Questions (Q92-Q97):

NEW QUESTION # 92

Workflows can reference actions in:

(Each correct answer presents a complete solution. Choose three.)

- A. A published Docker container image on Docker Hub.
- B. Any public repository.
- C. GitHub Packages.
- D. The same repository as your workflow file.
- E. An enterprise marketplace.

Answer: A,B,D

Explanation:

In GitHub Actions workflows, actions can be referenced from various sources depending on the needs of the workflow.

Any Public Repository:

Option A is correct. Actions can be referenced from any public GitHub repository, allowing the reuse of shared actions across multiple projects.

The Same Repository as Your Workflow File:

Option B is correct. Actions stored in the same repository as the workflow file can be referenced directly, which is common for custom actions specific to that project.

A Published Docker Container Image on Docker Hub:

Option E is correct. Workflows can reference actions that are provided as Docker container images hosted on Docker Hub, allowing integration of complex tools and environments.

Incorrect Options:

Option C (GitHub Packages) is incorrect as it is more commonly used for storing and managing dependencies, not actions.

Option D (An enterprise marketplace) is incorrect because GitHub Actions are not directly referenced from an enterprise marketplace but rather from public repositories or Docker images.

NEW QUESTION # 93

What is the difference between Git and GitHub?

- A. Git is a cloud-based hosting service, while GitHub is a distributed version control system.
- B. Git is a command-line tool for tracking file changes, while GitHub is a platform for collaborating on Git repositories.
- C. Git and GitHub are different names for the same tool that is used for version control and collaboration.
- D. Git is a centralized version control system, while GitHub is a cloud-based collaboration platform.

Answer: B

Explanation:

About GitHub and Git

About GitHub

GitHub is a cloud-based platform where you can store, share, and work together with others to write code.

Storing your code in a "repository" on GitHub allows you to:

Showcase or share your work.

Track and manage changes to your code over time.

Let others review your code, and make suggestions to improve it.

Collaborate on a shared project, without worrying that your changes will impact the work of your collaborators before you're ready to integrate them.

Collaborative working, one of GitHub's fundamental features, is made possible by the open-source software, Git, upon which GitHub is built.

About Git

Git is a version control system that intelligently tracks changes in files. Git is particularly useful when you and a group of people are all making changes to the same files at the same time.

NEW QUESTION # 94

Which of the following are included as pre-defined repository roles?

(Each answer presents a complete solution. Choose three.)

- A. Write
- B. Security
- C. View
- D. Delete
- E. Maintain
- F. Triage

Answer: A,E,F

Explanation:

GitHub provides several pre-defined repository roles that determine the level of access and permissions a user has within a repository. The roles that are included by default are:

Triage: Allows users to manage issues and pull requests without write access to the code.

Maintain: Provides more extensive access, including managing settings, but without full administrative control.

Write: Grants permission to push changes and manage issues and pull requests.

Roles like "Security" and "Delete" are not standard pre-defined roles, and "View" is generally referred to as "Read" in GitHub's permission structure.

NEW QUESTION # 95

Which of the following two-factor authentication (2FA) methods can you use to secure a GitHub account?

(Each answer presents a complete solution. Choose three.)

- A. Security questions
- B. Single sign-on
- C. GitHub mobile
- D. Authenticator app
- E. Security keys

Answer: C,D,E

Explanation:

The following two-factor authentication (2FA) methods can be used to secure a GitHub account:

A . Authenticator app: You can use an authenticator app (like Google Authenticator or Authy) to generate time-based one-time passwords (TOTP) for logging in.

C . GitHub mobile: The GitHub mobile app can also be used to receive 2FA codes, adding convenience for users who prefer to manage everything from their mobile devices.

D . Security keys: Physical security keys (such as YubiKeys) can be used as a strong form of 2FA, requiring physical access to the

key to authenticate.

Security questions and Single sign-on (SSO) are not considered 2FA methods in the context of GitHub account security.

NEW QUESTION # 96

What are the two main reasons why one might fork a repository?
(Each answer presents a complete solution. Choose two.)

- A. To create an issue or open a discussion
- **B. To propose changes to the base repository**
- **C. To create a new repository based on an existing one**
- D. To create a new branch to develop a new feature

Answer: B,C

Explanation:

Forking a repository on GitHub is a common practice, especially when contributing to open-source projects or when you want to build on existing work. Here are the two main reasons for forking a repository:

* B. To propose changes to the base repository :

* One of the primary reasons for forking a repository is to make changes or improvements that you can later propose to the original repository (often called the "upstream" repository). This is typically done through a pull request. By forking the repository, you get your own copy of the project where you can freely experiment, make changes, and then propose those changes back to the original project.

* C. To create a new repository based on an existing one :

* Forking is also used to create a new repository that is a copy of an existing one. This allows you to work on the project independently of the original repository, effectively creating a new direction for the project or using it as a starting point for a different purpose. This is particularly useful for customization, experimentation, or when you want to build something different while still leveraging the existing codebase.

Explanation of Other Options :

* A. To create an issue or open a discussion :

* This is incorrect because creating an issue or opening a discussion can be done directly on the original repository without needing to fork it. Forking is unnecessary for these actions.

* D. To create a new branch to develop a new feature :

* While creating a new branch is related to development, it does not require a fork. Branches are typically created within the same repository to work on new features. Forking is used when you need an entirely separate copy of the repository.

Given this information, the correct answers are B and C .
