Axis Network Video Exam Sample Questions (Q112-Q117):

NEW QUESTION # 112

In good conditions, a pixel density of 250 px/m (80 px/ft) is required for

- A. detection.
- **B. identification.**
- C. recognition.
- D. observation.

Answer: B

Explanation:

In good conditions, a pixel density of 250 px/m (80 px/ft) is required for identification purposes. This means that at this resolution, the image quality is sufficient to identify individuals, objects, or other details accurately.

Identification requires the highest level of detail among the common surveillance objectives (detection, observation, recognition, identification). This pixel density allows for clear and precise visual information necessary for identifying specific features such as facial characteristics or license plates.

NEW QUESTION # 113

which describes an opportunistic attack?

- A. Often organized, with several people involved
- **B. The attacker is usually not acquainted with the target**
- C. Targeted at a specific system with a specific goal
- D. Typically performed by a person with legitimate access

Answer: B

Explanation:

An opportunistic attack is characterized by the attacker not being acquainted with the target. These attacks are typically random and take advantage of any available vulnerability rather than being specifically targeted at a particular system or organization. The attacker usually seeks easy targets with known vulnerabilities and acts quickly when an opportunity arises. Axis security documentation describes opportunistic attacks as generally unsophisticated, focusing on exploiting common and readily available weaknesses in systems.

NEW QUESTION # 114

Which is the main advantage of Axis P-iris technology?

- A. It limits motion blur
- **B. It optimizes the aperture, limiting artifacts**
- C. It improves low light performance
- D. It reduces purple fringing

Answer: B

Explanation:

Axis P-iris technology is designed to optimize the camera's aperture to achieve better image quality. By precisely controlling the iris opening, P-iris technology can maintain the ideal aperture size for various lighting conditions. This helps limit optical artifacts such as diffraction and spherical aberration, ensuring sharp and clear images. While it can contribute to improved low light performance and reduce motion blur, its main advantage is optimizing the aperture to limit artifacts. Axis Network Video documentation explains that P-iris provides more precise iris control compared to traditional DC-iris, leading to enhanced image quality.

NEW QUESTION # 115

Which layer 4 protocol has less overhead information?

- **A. UDP**
- B. HTTP
- C. IP

- D. TCP

Answer: A

Explanation:

UDP (User Datagram Protocol) has less overhead information compared to TCP (Transmission Control Protocol). UDP is a simpler, connectionless protocol that does not require handshaking or error-checking mechanisms, resulting in lower overhead and faster transmission of data. This makes UDP more efficient for real-time applications such as video streaming, as detailed in Axis Communications' technical guides on network protocols.

NEW QUESTION # 116

For which purposes would a thermal network camera be a viable alternative to a standard network camera?
(Choose three)

- A. Detection at daylight
- B. Identification of a person
- C. Detection at night
- D. Detection in smoke and light fog conditions
- E. License Plate Recognition

Answer: A,C,D

Explanation:

Thermal network cameras are viable alternatives to standard network cameras for several purposes:

* B. Detection at daylight: Thermal cameras can detect heat signatures from objects and people regardless of lighting conditions.

* C. Detection at night: They can effectively detect heat signatures in complete darkness, making them suitable for nighttime surveillance.

* D. Detection in smoke and light fog conditions: Thermal cameras can see through obscurants like smoke and light fog that might block visible light, providing reliable detection in such conditions.

Thermal cameras are not suitable for identification purposes or license plate recognition as they do not capture fine details needed for these applications.
