EMC Dell Technologies PowerMax Operate Sample Questions (Q135-Q140):

NEW QUESTION # 135

When reviewing storage group compliance for a specific storage group, you notice that the weighted response time for the storage group over the last four hours is compliant. Upon further research, you see that the weighted response time for the last two weeks does not meet the defined response time for the assigned service level.

What is the overall compliance status for the storage group?

- A. Stable
- B. Non-compliant
- C. Marginal
- D. Critical

Answer: B

Explanation:

Step by Step Comprehensive Detailed Explanation:

When evaluating storage group compliance in PowerMax, Unisphere considers the weighted response time of the storage group against its defined service level objectives (SLOs). The compliance status is determined based on how well the storage group meets its response time goals over different time periods.

In this case, even though the storage group's weighted response time is compliant over the last four hours, the fact that it does not meet the defined response time for the last two weeks indicates an overall non-compliant status.

This means that while the storage group might be performing adequately in the short term, it has not consistently met its performance goals over a longer period. This could indicate potential performance issues or the need for adjustments to the storage group's configuration or service level.

Why other options are incorrect:

* A. Stable: A stable status would indicate consistent compliance over all time periods.

* B. Marginal: A marginal status might suggest borderline performance, but not necessarily a clear violation of SLOs.

* D. Critical: A critical status would likely indicate a severe performance issue or a significant breach of SLOs.

NEW QUESTION # 136

A TimeFinder SnapVX snapshot of source volumes has been linked to target volumes. The target volumes are being used for application testing.

What should be done prior to a relink operation?

- A. Continue accessing the source volumes; stop accessing the target volumes
- B. Continue accessing the source and target volumes
- C. Stop accessing the source and target volumes
- D. Stop accessing the source volumes; continue accessing the target volumes

Answer: A

NEW QUESTION # 137

When is the Unisphere Lockbox password required?

- A. Upgrading Unisphere for PowerMax
- B. Creating performance charts
- C. Logging into Unisphere for PowerMax
- D. Performing administration tasks

Answer: A

NEW QUESTION # 138

When using TimeFinder SnapVX technology, what is the maximum number of target volumes that can be linked to a snapshot on a single source volume?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Step by Step Comprehensive Detailed Explanation:

TimeFinder SnapVX is a snapshot technology in PowerMax that allows you to create point-in-time copies of data. When using SnapVX, you can link target volumes to a snapshot to create writable copies of the data at that specific point in time.

The maximum number of target volumes that can be linked to a single snapshot on a source volume is 255.

This limitation ensures efficient management and performance of the SnapVX snapshots and linked targets.

Why other options are incorrect:

* B. 256, C. 512, D. 1024: These numbers exceed the maximum limit of linked targets per snapshot.

NEW QUESTION # 139

What is an update operation in SRDF on PowerMax arrays?

- A. A process used to return to the original production site after a failover event
- B. A process that allows separate hosts to access the same data independently
- C. process to retain the data on the target R2 side
- **D. A process that initiates an incremental copy from the target R2 to the source R1**

Answer: D

Explanation:

Step by Step Comprehensive Detailed Explanation:

In SRDF (Symmetrix Remote Data Facility), an "update" operation refers to a specific process where changes made on the target (R2) side are copied back to the source (R1) side. This is typically used in disaster recovery scenarios where:

- * Failover: A failover occurs, and the target (R2) becomes the active production site.
- * Data Modification: Data is modified or updated on the target (R2) while it's acting as the primary.
- * Update Operation: An "update" is initiated to synchronize the changes from the target (R2) back to the source (R1), ensuring that the source has the latest data.

This process is crucial for maintaining data consistency and ensuring a smooth transition back to the original production site after a failover event.

Why other options are incorrect:

- * A. process to retain the data on the target R2 side: This is not specific to an "update" operation. Data retention on the target is a general aspect of SRDF.
- * B. A process used to return to the original production site after a failover event: While an "update" is part of the failback process, it's not the entire process itself. Failback involves other steps like reversing replication direction and restoring host access.
- * D. A process that allows separate hosts to access the same data independently: This describes a different SRDF configuration (like Active/Active) and is not related to the "update" operation.

- * Dell Solutions Enabler 10.0.0 SRDF Family CLI User Guide: This guide provides detailed information about SRDF commands and operations, including the symrdf update command used to initiate an update from R2 to R1.
