The only use of the internet is to validate the product license for the D-PWF-OE-00 practice exam software. If you are not online, you can still practice for the EMC D-PWF-OE-00 exam questions thanks to this feature of Prep4sureExam's D-PWF-OE-00 Exam simulation software. As a result, the D-PWF-OE-00 desktop-based practice test software is a particularly useful option for customers who do not constantly have access to the internet.

## EMC Dell PowerFlex Operate Exam Sample Questions (Q63-Q68):

### NEW QUESTION # 63

What actions can administrators perform to manage PowerFlex shared file systems? (Choose two).

- A. Enable data access for multiple nodes
- B. Assign file systems to fault sets
- C. Deduplicate shared file system data
- D. Configure snapshots for shared file systems

**Answer: A,D**

Explanation:

PowerFlex File (NAS) extends the block capabilities to support file-level access.

\* Enable data access for multiple nodes (Option B): The fundamental purpose of a shared file system (NAS) is to allow multiple clients (Linux via NFS, Windows via SMB) to access the same dataset simultaneously over the network. PowerFlex File manages the exports and shares that facilitate this concurrency.

\* Configure snapshots for shared file systems (Option C): Just like block volumes, PowerFlex File systems support snapshots.

These file-system level snapshots allow users to recover deleted files or administrators to roll back the entire file system to a previous point in time.

Incorrect Options:

\* Assign file systems to fault sets (A): Fault Sets are a block-layer construct for physical SDS nodes. File systems are logical entities that reside on the storage provided by the block layer; they are not directly assigned to Fault Sets.

\* Deduplicate shared file system data (D): Deduplication occurs at the underlying Storage Pool level (inline), not as a management action performed on a specific file system.

### NEW QUESTION # 64

What steps are required to configure a Storage Pool? (Choose two).

- A. Assign drives with similar performance characteristics
- B. Enable replication between clusters
- C. Define the Protection Domain
- D. Configure VLAN tagging for the Storage Pool

**Answer: A,C**

Explanation:

A Storage Pool is a logical entity that aggregates the capacity of physical devices.

\* Define the Protection Domain (Option A): The Storage Pool hierarchy is strict. You must first create a Protection Domain (PD), which groups the SDS nodes. The Storage Pool is then created within that Protection Domain. You cannot create a Storage Pool without this parent container.

\* Assign drives with similar performance characteristics (Option B): This is a critical configuration requirement. PowerFlex stripes data across all drives in a pool. If you mix NVMe and SATA drives in the same pool, the fast NVMe drives will wait for the slow SATA drives, dragging the entire pool's performance down to the lowest common denominator (the "straggler" effect). Therefore, standard procedure is to create separate pools for separate media types (e.g., "Performance\_Pool" for NVMe, "Capacity\_Pool" for HDD).

### NEW QUESTION # 65

What is the primary function of storage data targets in PowerFlex?

- A. Provide access to external storage resources
- B. Manage metadata for nodes
- C. Enable deduplication and compression
- D. Organize drives for storage pools

**Answer: D**

Explanation:

In PowerFlex terminology, the Storage Data Server (SDS) acts as the "Target" for I/O operations.

\* Organize drives for storage pools (Option B): The SDS takes ownership of the local physical drives (NVMe/SSD/HDD) installed in the server. It aggregates these drives and contributes them to the Storage Pool. It handles the reading and writing of data blocks to this physical media.

Incorrect Options: Metadata is managed by the MDM (A). Access to external resources (C) is not the function of the SDS (which provides internal storage). Deduplication (D) is a specific feature, not the primary function of the component.

#### NEW QUESTION # 66

What is the purpose of integrating CloudLink with PowerFlex?

- **A. To enable secure key management for encryption**
- B. To provide real-time monitoring for security events
- C. To configure VLAN tagging for secure communication
- D. To manage metadata for storage pools

**Answer: A**

Explanation:

Dell CloudLink is the security partner for PowerFlex. Its specific role is Key Management for Data at Rest Encryption (D@RE). When PowerFlex uses software-based encryption or Self-Encrypting Drives (SEDs), it needs a secure external entity to hold the "keys to the castle." CloudLink generates, stores, and serves these keys to the PowerFlex nodes upon boot. If a drive is stolen, it cannot be read because the thief does not have access to the CloudLink key manager to unlock the data.

#### NEW QUESTION # 67

Shared file systems in PowerFlex allow data sharing across multiple nodes. True or False?

- **A. True**
- B. False

**Answer: A**

Explanation:

This refers to PowerFlex File (formerly PowerFlex NAS).

While the core PowerFlex product is a block storage solution (providing raw LUNs/Volumes which cannot be safely shared by two standard OS hosts without a cluster file system like VMFS or OCFS2), PowerFlex File introduces NAS nodes. These nodes format the block storage and present it via NFS or SMB protocols. These protocols are specifically designed to allow multiple clients to read and write to the same file system concurrently, enabling true data sharing across the network.

In today's competitive technology sector, the EMC D-PWF-OE-00 certification is a vital credential. Many applicants, however, struggle to obtain up-to-date and genuine EMC D-PWF-OE-00 exam questions in order to successfully prepare for the exam. If you find yourself in this circumstance, don't worry since Prep4sureExam has you covered with their real EMC D-PWF-OE-00 Exam Questions. Let's look at the characteristics of these EMC Dell PowerFlex Operate Exam test Questions and how they can help you pass the EMC D-PWF-OE-00 certification exam on the first try.
