## CrowdStrike Certified SIEM Engineer Sample Questions (Q16-Q21):

### NEW QUESTION # 16

You need to import a pre-built workflow into Fusion SOAR to automate a part of your incident response process. Which file format would you use?

- **A. .YAML**
- B. .PY
- C. .CPP
- D. .JSON

**Answer: A**

Explanation:

The best-supported answer is D. .YAML .

CrowdStrike's recent Falcon Fusion SOAR technical content shows workflow structures represented in YAML . In particular, CrowdStrike's workflow-based pagination example for Falcon Fusion SOAR says, "The following YAML shows the workflow structure," and then provides the workflow definition in YAML form. That indicates YAML is the workflow definition format used in documented examples for reusable/pre- built workflow structures.

Why the other options are incorrect:

A (.CPP) and C (.PY) are programming language source files, not workflow import formats for Fusion SOAR. B (.JSON) is heavily used elsewhere in the platform for schemas, API payloads, and structured data, but the CrowdStrike materials I found that specifically show workflow structure present it in YAML , not JSON. Based on that documented workflow representation, .YAML is the correct answer here.

### NEW QUESTION # 17

You need to ingest data from a custom internal application hosted on-prem. The application writes logs to a file on a syslog server. Which data connector would you use?

- A. Amazon S3 Data Connector
- B. Azure Virtual Machines Data Connector
- **C. HTTP Event Connector**
- D. Google Cloud Pub / Sub Data Connector

**Answer: C**

Explanation:

The correct answer is B. HTTP Event Connector .

CrowdStrike describes the HTTP Event Connector (HEC) as the generic mechanism used to bring third- party data into Falcon Next-Gen SIEM when you need to onboard logs from sources that are not tied to a specific cloud-native connector. CrowdStrike's own Next-Gen SIEM materials highlight pre-built connectors and HTTP Event Collectors as the way to extend visibility to many different third-party sources.

Because this question describes a custom internal application hosted on-prem , the cloud-specific connectors in options A , C , and D do not fit. The broad, flexible connector option intended for custom or non-native sources is the HTTP Event Connector . Also, CrowdStrike's vCenter example shows an architecture where logs are first centralized and then onboarded to Falcon Next-Gen SIEM through an HTTP Event Connector , which aligns with this kind of custom-source pattern.

### NEW QUESTION # 18

You notice that the format of incoming logs suddenly changes from JSON format to key-value pairs during log collection. What action would you take to parse the data correctly?

- A. Restart the log collector in debug mode
- B. Switch to fleet mode and monitor the logs
- **C. Use a multi-source configuration with different parsers per source**
- D. Disable parsing entirely

**Answer: C**

Explanation:

The correct answer is A. Use a multi-source configuration with different parsers per source .

CrowdStrike's Falcon LogScale Collector documentation states that parsers can be set for each source . The collector configuration model also explains that the Sources section defines the source of the data, filters to be applied, and parsers . That means when different log formats are being collected, the correct design is to separate them by source and assign the appropriate parser to each source.

Why the other options are incorrect:

Switching to fleet mode or monitoring logs does not itself correct parsing logic. Restarting in debug mode may help troubleshoot, but it does not solve the format mismatch. Disabling parsing would make the data less useful, not more useful. The documented way to handle parser differences is to apply parsers at the source level.

### NEW QUESTION # 19

Which field is compliant with CrowdStrike Parsing Standard (CPS)?

- A. Parser.type
- B. #event.trigger
- C. Parser.name
- D. #event.dataset

**Answer: D**

Explanation:

The correct answer is B. #event.dataset .

CrowdStrike's CPS documentation explicitly lists #event.dataset as one of the CPS-compliant parser tags.

The CPS migration documentation also repeats that CPS-compliant parsers use tags for fields including #ecs.version , #event.dataset , and #event.kind .

Why the other options are incorrect:

Parser.type and Parser.name are not listed as CPS-compliant tags in the CPS standard.

#event.trigger is also not listed among the CPS-compliant fields/tags.

Therefore, the only CPS-compliant option given is #event.dataset .

### NEW QUESTION # 20

What is the purpose of labels in Fleet Management?

- A. Categorize collectors for group configurations
- B. Set passwords for collector instances
- C. Monitor network traffic
- D. Assign IP addresses to collectors

**Answer: A**

Explanation:

CrowdStrike's Fleet Management documentation for Falcon LogScale Collector explains that labels are used to associate metadata with a Fleet Management configuration and with collector instances so they can be tagged, identified, organized, and filtered. The docs specifically describe labels as helping organize collectors by criteria such as environment, region, service, or other custom values. That directly matches option B:

Categorize collectors for group configurations .

Why the other options are incorrect:

Option A is incorrect because labels are not used for authentication or password management.

Option C is incorrect because labels do not perform traffic monitoring; they are metadata for organization and selection.

Option D is incorrect because labels do not assign network settings such as IP addresses.
