Free PDF Drupal-Site-Builder Online Training Materials | Easy To Study and Pass Exam at first attempt & Updated Drupal-Site-Builder: Acquia Certified Drupal Site Builder Exam for Drupal 10, 11

Acquia is obliged to give you 12 months of free update checks to ensure the validity and accuracy of the Acquia Drupal-Site-Builder exam dumps. We also offer you a 100% money-back guarantee, in the very rare case of failure or unsatisfactory results. This puts your mind at ease when you are Acquia Drupal-Site-Builder Exam preparing with us.

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q31-Q36):

NEW QUESTION # 31

Your Main navigation menu has two levels of menu items like sections, and child pages within each section.

Your UX team wants to make it easier for a site visitor viewing a child page to see what other pages are in that section. They have asked you to add a submenu to the Sidebar region on child pages.

How can you add a submenu to the child pages that shows all child pages in the section?

- A. In Block layout, place the Main navigation block in the Sidebar region. Set the initial visibility level to 1.
- B. Add the Main navigation menu to the Sidebar region, and use CSS to hide the top level menu items.
- **C. In Block layout, place the Main navigation block in the Sidebar region. Set the initial visibility level to 2.**
- D. Create a new menu for each main section containing links for each child page, and add each menu's block to the Sidebar region.

Answer: C

Explanation:

In Drupal 10 and Drupal 11, menus can be displayed as blocks and configured to show specific levels of the menu hierarchy. The "Main navigation" block includes settings such as "Starting level" (or initial visibility level) and "Maximum number of levels to display." These settings allow site builders to control which part of the menu tree is visible in a given region. To display only the child pages (submenu items) when a user is on a child page, you need to configure the block to start displaying from level 2, which corresponds to the submenu under the current top-level section. This ensures that only relevant sibling pages within the same section are shown in the sidebar, improving usability and navigation. Option B (level 1) would still show top-level menu items, not just the submenu. Option A is not recommended because using CSS to hide elements does not follow Drupal's configuration best practices. Option D is unnecessary and inefficient, as Drupal's menu system already supports hierarchical display without creating duplicate menus. Thus, configuring the menu block with an initial visibility level of 2 is the correct and recommended approach.

NEW QUESTION # 32

Your website has a content type named Hotel with a Taxonomy reference field for Landmarks vocabulary. You want to create a view to list all the hotels filtered by landmarks as a contextual filter. How will you pass the term name in the URL for the contextual filter?

- A. Add Landmarks vocabulary as a relationship and then add Landmarks vocabulary as a contextual filter.
- B. Add Landmarks vocabulary as an exposed filter pass term name as the filter value.
- C. Add Landmarks vocabulary as a contextual filter and pass term name as a contextual filter.
- D. Add Landmarks vocabulary both as an exposed filter and contextual filter.

Answer: C

Explanation:

In Drupal 10 and Drupal 11, Views contextual filters are used to dynamically filter content based on values passed through the URL. When filtering content by taxonomy (such as Landmarks), you configure a contextual filter using the taxonomy term field associated with the content type.

To pass a value like a term name in the URL, you must configure the contextual filter to accept term identifiers such as term ID or term name. Drupal Views allows validation and transformation of contextual input, including using the taxonomy term name via settings like "Provide default value" or "Specify validation criteria." This matches option B.

Option A is incorrect because exposed filters rely on user input via UI forms, not URL path arguments.

Option C is unnecessary duplication and not aligned with best practices. Option D is not required because taxonomy reference fields already provide the necessary relationship internally for filtering; explicitly adding a relationship is only needed in more complex multi-entity scenarios.

Therefore, the correct approach is to use a contextual filter configured to accept the taxonomy term (including term name) via the URL, making option B correct.

NEW QUESTION # 33

You manage a popular news portal which has a very busy comments section. You've been asked to add several new fields and a View for the news area of a site. The QA team wants to review your work in staging before rolling everything out to production at once. The editorial team has specified that the site's comments activity should not be affected by these changes. How can you meet these requirements without having to create the new functionality independently in both environments?

- A. Create the fields and View in a development copy of the site. Export the site configuration to code. Push that code to the staging environment and import the site configuration there. Once QA is satisfied, repeat the process in production.
- B. Configuration created in the staging environment is automatically available to the production environment since they share a database.
- C. Copy the production database into the staging environment. Create the fields and View there. Once QA is satisfied, copy the staging database into the production environment.
- D. Create the fields and View in a fresh installation of Drupal core. Export the site configuration into your site's existing codebase, push the code to the staging environment, and import the site configuration there. Once QA is satisfied, repeat the process in production.

Answer: A

Explanation:

Drupal's configuration management system is specifically designed to move site configuration -such as content types, fields, vocabularies, and Views-between environments by exporting configuration to files and then importing it elsewhere. Drupal

documentation explicitly describes configuration as the administrative settings that determine how the site functions, and it lists fields and views as examples of configuration.

That makes option D the correct workflow: build the new fields and View on a development copy of the site, export the configuration to code, deploy that code to staging, import it for QA review, and then repeat the import in production after approval. This preserves live editorial activity such as comments, because comments are site content, not configuration, and configuration deployment avoids overwriting production content with a copied database.

Option A is risky because copying the staging database back to production could overwrite live comments and other newly created production content. Option B is false because staging and production do not automatically share configuration through one database in a normal deployment workflow. Option C is inferior because configuration should be created from a development copy of the actual site, where the existing modules, schema, and site setup already match the target environments.

NEW QUESTION # 34

What is meant by headless Drupal?

(Select 2 options)

- A. Applying security updates automatically to Drupal installation
- B. Publishing content automatically in Drupal
- C. Just another phrase for "decoupled Drupal"
- D. Exposing Drupal content to other systems such as native applications.

Answer: C,D

Explanation:

In Drupal's official documentation, headless Drupal is described as decoupled Drupal. The documentation explains that decoupled, or headless, Drupal separates the backend content management part of Drupal from the frontend presentation layer. In this architecture, Drupal is used as a content repository and content API, while the frontend can be built with other technologies such as JavaScript frameworks or consumed by other clients. This directly supports option C. Drupal documentation also explains that this architecture allows Drupal content to be exposed to other systems and applications through APIs such as JSON:API or REST. That means Drupal can provide content to websites, mobile apps, kiosks, or other digital channels, which matches option B. The purpose of headless Drupal is therefore not automatic updates or automatic publishing, so options A and D are not correct. So, according to Drupal 10 and Drupal 11 documentation, the correct understanding is that headless Drupal means decoupled Drupal and involves exposing Drupal-managed content to external systems or applications through APIs.

NEW QUESTION # 35

Recent log entries of your site show that there are too many failed login attempts for the site super admin user (user 1). How can you better secure the Drupal super admin user (user 1) from outside attacks?

- A. Do not give this user an obvious name like "admin" or "administrator" which are too easy to guess.
- B. Only allow members of the Drupal community in good standing to be user 1.
- C. Cancel the user account for user 1.
- D. Remove the "Administrator" role from user 1, which makes them an anonymous user.

Answer: A

Explanation:

Drupal's official security guidance for the super user account (user 1) specifically recommends that administrators do not name the first account "admin" or something obvious. The reason is straightforward: obvious usernames make brute-force and credential-guessing attacks easier, because attackers already know half of the login credentials they need to target. Drupal's administration and security documentation also recommends limiting direct use of user 1 and protecting it carefully because it is a uniquely powerful account.

That makes option D the correct answer. The other options do not match Drupal's documented best practices.

There is no Drupal security rule about "members of the Drupal community in good standing" being allowed to use user 1. Canceling the user 1 account is not the recommended solution for this situation, and removing the Administrator role from user 1 would not make the account anonymous; in Drupal, user 1 is a special account with superuser behavior that is handled separately from ordinary role assignment. Drupal's own guidance emphasizes safer naming and tighter handling of the account, not these alternative actions.

NEW QUESTION # 36

.....

We provide all candidates with Drupal-Site-Builder test torrent that is compiled by experts who have good knowledge of exam, and they are very experience in compile Drupal-Site-Builder study materials. Once we have latest version, we will send it to your mailbox as soon as possible. our Drupal-Site-Builder exam questions just need students to spend 20 to 30 hours practicing can let them have the confidence to pass the Drupal-Site-Builder Exam, so little time great convenience for some workers. It must be your best tool to pass your Drupal-Site-Builder exam and achieve your target.
