CompTIA SecAI+ Certification Exam Sample Questions (Q79-Q84):

NEW QUESTION # 79

Which of the following strengthens the performance of a large language model (LLM) for malicious reconnaissance?

- A. Instructing an AI assistant to query as an administrator
- **B. Enhancing a foundational model with the inclusion of retrieval-augmented generation (RAG)**
- C. Prompting a chatbot to describe server naming patterns and Internet Protocol (IP) ranges
- D. Creating a web scraper script using AI to capture the company website

Answer: B

Explanation:

RAG augments an LLM with external, up-to-date information retrieval, improving its factual accuracy and contextual scope-capabilities that directly strengthen the model's effectiveness for reconnaissance.

NEW QUESTION # 80

An organization is developing and implementing AI features into a customer service application.

Which of the following practices should the organization put the place before releasing the application for customer trials?

- A. Approved AI vendor lists
- B. Third-party risk management
- C. External compliance audits
- D. Data masking and sanitization

Answer: D

Explanation:

Before releasing AI features for customer trials, it is critical to protect sensitive information that may be used during testing. Data masking and sanitization ensure customer or corporate data is anonymized or obfuscated, reducing the risk of data exposure while still allowing realistic evaluation of the AI system.

NEW QUESTION # 81

Which of the following would most likely be used to prove that an image is AI generated?

- A. Watermarking
- B. Guardrails
- C. Human validation
- D. Diffusion

Answer: A

Explanation:

Watermarking embeds hidden, verifiable markers into AI-generated images. These markers can later be detected to prove the image originated from an AI system, making it the most reliable method for verification.

NEW QUESTION # 82

An attacker successfully completes a denial-of-service (DoS) attack through the context window of an AI system. Thousands of characters are obfuscated and hidden behind an emoji. Which of the following techniques best mitigates this type of attack?

- A. Large language model (LLM)-as-a-judge
- B. Prompt filter
- C. Pattern recognition
- D. Fraud detection

Answer: B

Explanation:

A DoS attack through the context window relies on overwhelming the model with excessive or obfuscated input. Prompt filtering prevents such malicious or oversized inputs from being processed, ensuring that the model only receives safe, properly structured data within acceptable limits.

NEW QUESTION # 83

Hotspot Question

Instructions

Use the drop-down menus to define two appropriate security controls for each component of the AI system. Each control may be used only once.

An engineer is deploying a new AI system and wants to integrate it into the core system through an API.

□

Answer:

Explanation:

□

Explanation:

Cloud control plane: IAM policies, Resource policies

Prompt firewall: Injection policies, Output monitoring

WAF: Connection rate limits, Input token validation

Front-end API + Model + Vector database: Guardrails, Input quota

API gateway: Load balancing, Authentication token validation

Cloud control plane relies on IAM and resource policies to enforce centralized identity and access management as well as usage restrictions.

Prompt firewall protects against malicious input via injection policies and ensures outputs are monitored for compliance and safety. WAF controls connection rate to mitigate DoS and validates input tokens to stop unauthorized access attempts.

Front-end API, Model, and Vector database share guardrails to restrict unsafe behaviors and input quotas to prevent overuse, making them consistent and efficient security points.

API gateway enforces load balancing for availability and validates authentication tokens at the entry point, providing secure and scalable access.
