HPE Campus Access Switching Expert Written Exam Sample Questions (Q108-Q113):

NEW QUESTION # 108
Why is "linkup-delay-timer exclude lag-list" used in a VSX configuration?

- A. to ensure the ISL link is not blocked during the link-up delay
- B. to allow upstream router adjacencies to be established during the link-up delay
- C. to perform MSTP calculations correctly during the link-up delay
- D. to exclude every LAG where another switch is connected during the link-up delay

Answer: D

Explanation:
The linkup-delay-timer exclude lag-list command in a VSX configuration is used to exclude specific LAG interfaces that connect to other switches from the global link-up delay mechanism.
By default, the link-up delay timer holds down all interfaces for a defined period after a reboot to prevent loops and ensure stability. However, inter-switch connections (like LAGs to other switches) should not be delayed, as they are essential for fast VSX peer synchronization.
Excluding these LAGs ensures they come up immediately while still applying the delay to other access-facing ports.

NEW QUESTION # 109
Two CX 8325 switches are configured as a cluster using VSX for the core role and two CX
6300M in VSF for the aggregation role. When a minor software upgrade is issued on the switches, what is the method to achieve a hitless upgrade with the aggregation switches?

- A. VSF update-software initiates the software upgrade first on the primary switch, followed by the secondary.
- B. ISSU update-software initiates the upgrade first on the secondary switch, followed by the primary.
- C. VSF update-software initiates the software upgrade first on the secondary switch, followed by the primary.
- D. ISSU update-software initiates the upgrade first on the primary switch, followed, by the secondary.

Answer: C

Explanation:
For CX 6300M switches in a VSF (Virtual Switching Framework), the correct method for a hitless (non-disruptive) minor software upgrade is to use the vsf update-software command. The process always upgrades the secondary member first, then the primary, ensuring continuous forwarding and minimizing downtime.

NEW QUESTION # 110
Refer to the exhibit.
Based on the screenshot, what is required to bring the secondary switch MCLAG interfaces online?

- A. Use the same CX OS version as on the primary.
- B. Use the same ServiceOS version as on the primary.
- C. Update the NAE agents on the secondary.
- D. Use vsx-software-upgrade on the secondary.

Answer: A

Explanation:
The error messages (sw_image_version_mismatch_error) in the VSX status output indicate that the primary (GL.10.09.0010) and secondary (GL.10.11.1021) switches are running different AOS- CX software versions. For VSX peers to synchronize and bring MCLAG interfaces online, both devices must run the same AOS-CX software version.

NEW QUESTION # 111
What is the most secure way to configure HPE Aruba Networking access points for employee/guest access?

- A. Use WPA2 Enterprise encryption with a RADIUS server but use a weak pre-shared key (PSK) for the RADIUS server.
- B. Use a single SSID for employee and guest access and configure a captive portal for guest access.
- C. Configure VLANs to segregate employee and guest traffic but use the same default password for all VLANs.
- D. Use separate SSIDs for employee and guest access and configure an HPE Aruba Networking ClearPass Policy Manager for guest authentication.

Answer: D

Explanation:
Separate SSIDs ensure traffic segregation between employees and guests.
Employees can use 802.1X with WPA2/WPA3-Enterprise for secure authentication via RADIUS.
Guests can be directed to ClearPass Guest Captive Portal for secure onboarding and controlled access.
This provides the highest level of security and policy enforcement compared to the other options.

NEW QUESTION # 112

A Python developer was able to read but could not modify the VLAN database on an AOS-CX switch through the REST API. Which settings should the developer check first? (Choose two.)

- A. cookie settings
- B. HTTPS settings
- C. SNMP settings
- D. SSH settings
- E. REST API settings

Answer: B,E

Explanation:
HTTPS settings → Required because the AOS-CX REST API runs over HTTPS. If HTTPS is not enabled, write operations will fail.
REST API settings → Must be checked to ensure that the REST API write mode (read/write vs.
read-only) is enabled.
