### dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q129-Q134):

#### NEW QUESTION # 129

You have a dbt project with models defined as views. After deploying to a production database, the view objects are present, but no data is displayed when querying them. What might be the root cause?

- A. Permissions granted in production don't allow reading data from the underlying tables.
- B. Dbt view materializations behave differently in production.
- C. Your dbt job didn't run successfully, so the views were created empty.
- D. There's a bug in dbt's SQL generation that specifically affects views in certain environments.

**Answer: A**

Explanation:

B is a common security-related cause of 'missing' data. The others are less likely; views, logs, and dbt core logic tend to be consistent.

#### NEW QUESTION # 130

Which two configurations can be applied to a dbt test?

Choose 2 options.

- A. on\_schema\_change
- B. persist\_docs
- C. tags
- D. materialized
- E. enabled

**Answer: C,E**

Explanation:

The correct answers are B: tags and C: enabled.

dbt tests-both generic and singular-support a limited but clearly defined set of configurations. Two of the supported configurations are tags, which allow grouping and selecting tests using dbt's selector syntax, and enabled, which can be set to true or false to control whether a test should run. These configurations are commonly used to manage large test suites, such as disabling slow tests in development or tagging tests for CI pipelines.

Option A (on\_schema\_change) is a model-only configuration and cannot be applied to tests.

Option D (materialized) applies only to models, not tests, since tests compile into queries that evaluate failures rather than physical objects.

Option E (persist\_docs) applies to models and sources for documentation purposes. Tests do not support persisted documentation properties beyond what appears in test metadata.

dbt's documentation makes clear that tests inherit only a small subset of configurations compared to models- primarily enabled, tags, severity, and custom test arguments. Among the options provided, only tags and enabled are valid and supported.

Thus, the correct answers are B and C.

#### NEW QUESTION # 131

Collaborative Fix

- A. All of the above.

- B. Include updated model documentation (dbt docs) outlining the logic and reasons for adjustment.
- C. Add clear commit messages that concisely summarize the purpose of the fix.
- D. Open a pull request with detailed comments explaining the rationale for the changes and any potential side-effects.

**Answer: A**

Explanation:

Changes need context! I-Jse comments, updated docs, and informative commit messages.

### NEW QUESTION # 132

Which of the following is true about restricting the usage of models in dbt?

Choose 1 option.

- **A. Model groups can limit references by other models which aren't in the same group.**
- B. Data platform user emails can be used to determine who can reference a model.
- C. Restrictions are set by defining the models and Git user groups approved for usage.
- D. You must map your data platform roles to groups by specifying the role name in the configurations.

**Answer: A**

Explanation:

The correct answer is C: Model groups can limit references by other models which aren't in the same group.

According to the dbt documentation, dbt provides a formal access-control mechanism for models through model groups and the access property. Models can be assigned to groups, and each model can be marked as public, protected, or private. The purpose of this system is to create clear boundaries within a project, making it possible to control which models are allowed to reference others. Specifically, dbt enforces rules where models in a group can restrict references from models outside that group, which helps maintain modularity and prevents accidental coupling of unrelated data layers. This is extremely valuable in large analytics engineering projects where teams manage different domains or data products.

Option A is incorrect because dbt does not use Git user groups or any form of identity-based access control for model usage.

Option B is incorrect because dbt does not integrate with warehouse roles for controlling model references-access is handled strictly within the dbt project's metadata. Option D is incorrect because user emails or platform identities have no role in determining which models can reference others. dbt enforces usage rules only through its metadata-driven grouping and access configuration system.

### NEW QUESTION # 133

You need to parameterize a dbt model that filters data based on a country code. Which approach offers the BEST combination of flexibility and security?

- A. Create a seed file mapping country codes to filter values and reference it in the model.
- B. Pass the country code as a CLI argument when executing dbt run.
- C. Build a dynamic query string entirely within a Jinja macro.
- **D. Use environment variables in conjunction with Jinja to substitute the country code.**

**Answer: D**

Explanation:

Environment variables provide control and help prevent SQL injection risks. While the other options might work, they are less secure or less flexible.
