Amazon AWS Certified Developer - Associate Sample Questions (Q359-Q364):

NEW QUESTION # 359

A company is concerned that a malicious user could deploy unauthorized changes to the code for an AWS Lambda function. What can a developer do to ensure that only trusted code is deployed to Lambda?

- A. Link Lambda to AWS KMS in the Lambda console. Use AWS KMS to digitally sign the Lambda package before deploying the package to Lambda.
- B. Set the `KmsKeyArn` property of the Lambda function to the Amazon Resource Name (ARN) of a trusted key before deploying the package to Lambda.
- C. Turn on the trusted code option in AWS CodeDeploy. Add the CodeDeploy digital certificate to the Lambda package before deploying the package to Lambda.
- **D. Define the code signing configuration in the Lambda console. Use AWS Signer to digitally sign the Lambda package before deploying the package to Lambda.**

Answer: D

NEW QUESTION # 360

A development team is working on a project in AWS CodeBuild that requires multiple interdependent builds to run simultaneously. The development team wants to optimize resource usage by combining Amazon EC2 On-Demand Instances and reserved capacity fleets for the builds. The builds include tasks for multiple platforms, such as web, mobile, and API components. Which solution will meet these requirements in the MOST cost-effective way?

- A. Configure a single CodeBuild project. Run all builds sequentially by using Reserved Instances.
- B. Create separate CodeBuild projects for each platform. Use On-Demand Instances for all builds.
- C. Create separate CodeBuild projects for each platform. Assign Reserved Instances or On-Demand Instances to each project based on resource availability.
- **D. Set up batch builds in CodeBuild. Define dependencies between platforms. Use a combination of Reserved Instances and On-Demand Instances.**

Answer: D

Explanation:

AWS CodeBuild batch builds allow multiple interdependent builds to run in parallel while managing dependencies. By using batch builds, the team can optimize resource usage and cost by leveraging a combination of Reserved Instances for predictable workloads and On-Demand Instances for additional capacity as needed, making this the most cost-effective solution.

NEW QUESTION # 361

An application under development is required to store hundreds of video files. The data must be encrypted within the application prior to storage, with a unique key for each video file.

How should the developer code the application?

- A. Use the KMS Encrypt API to encrypt the data. Store the encrypted data key and data.
- B. Upload the data to an S3 bucket using server side-encryption with an AWS KMS key.
- **C. Use the KMS GenerateDataKey API to get a data key. Encrypt the data with the data key. Store the encrypted data key and data.**
- D. Use a cryptography library to generate an encryption key for the application. Use the encryption key to encrypt the data. Store the encrypted data.

Answer: C

NEW QUESTION # 362

A developer is deploying a new application to Amazon Elastic Container Service (Amazon ECS). The developer needs to securely store and retrieve different types of variables. These variables include authentication information for a remote API, the URL for the API, and credentials. The authentication information and API URL must be available to all current and future deployed versions of the application across development, testing, and production environments.

How should the developer retrieve the variables with the FEWEST application changes?

- A. Update the application to retrieve the variables from each of the deployed environments. Define the authentication information and API URL in the ECS task definition as unique names during the deployment process.

- B. Update the application to retrieve the variables from an encrypted file that is stored with the application. Store the API URL and credentials in unique files for each environment.
- C. Update the application to retrieve the variables from AWS Key Management Service (AWS KMS). Store the API URL and credentials as unique keys for each environment.
- **D. Update the application to retrieve the variables from AWS Systems Manager Parameter Store. Use unique paths in Parameter Store for each variable in each environment. Store the credentials in AWS Secrets Manager in each environment.**

Answer: D

Explanation:

AWS Systems Manager Parameter Store is a service that provides secure, hierarchical storage for configuration data management and secrets management. The developer can update the application to retrieve the variables from Parameter Store by using the AWS SDK or the AWS CLI. The developer can use unique paths in Parameter Store for each variable in each environment, such as /dev/api-url, /test/api-url, and /prod

/api-url. The developer can also store the credentials in AWS Secrets Manager, which is integrated with Parameter Store and provides additional features such as automatic rotation and encryption.

NEW QUESTION # 363

A developer is creating a mobile application that will not require users to log in. What is the MOST efficient method to grant users access to AWS resources'?

- A. Use an identity provider to securely authenticate with the application.
- **B. Use Amazon Cognito to associate unauthenticated users with an IAM role that has limited access to resources.**
- C. Create an AWS Lambda function to create an IAM user when a user accesses the application.
- D. Create credentials using AWS KMS and apply these credentials to users when using the application.

Answer: B

Explanation:

This solution is the most efficient method to grant users access to AWS resources without requiring them to log in. Amazon Cognito is a service that provides user sign-up, sign-in, and access control for web and mobile applications. Amazon Cognito identity pools support both authenticated and unauthenticated users.

Unauthenticated users receive access to your AWS resources even if they aren't logged in with any of your identity providers (IdPs).

You can use Amazon Cognito to associate unauthenticated users with an IAM role that has limited access to resources, such as Amazon S3 buckets or DynamoDB tables. This degree of access is useful to display content to users before they log in or to allow them to perform certain actions without signing up. Using an identity provider to securely authenticate with the application will require users to log in, which does not meet the requirement. Creating an AWS Lambda function to create an IAM user when a user accesses the application will incur unnecessary costs and complexity, and may pose security risks if not implemented properly.

Creating credentials using AWS KMS and applying them to users when using the application will also incur unnecessary costs and complexity, and may not provide fine-grained access control for resources.
