

How Can You Pass the Salesforce PDII Exam Quickly and Easily?

BONUS!!! Download part of Lead1Pass PDII dumps for free: <https://drive.google.com/open?id=1y5d-SrbxaZlwzi-jzG0mldO6rMxslqzi>

It is a matter of common sense that pass rate of a kind of PDII exam torrent is the only standard to testify whether it is effective and useful. I believe that you already have a general idea about the advantages of our PDII exam question, but now I would like to show you the greatest strength of our PDII Guide Torrent --the highest pass rate. According to the statistics, the pass rate among our customers who prepared the exam under the guidance of our PDII guide torrent has reached as high as 98% to 100% with only practicing our PDII exam torrent for 20 to 30 hours.

Salesforce Certified Platform Developer II (PDII) certification exam is designed for professionals who have experience in building advanced applications on the Salesforce platform. Platform Developer II certification is one of the most prestigious and in-demand certifications in the Salesforce ecosystem. It validates the developer's expertise in designing and implementing complex business logic, data models, and custom user interfaces using Apex, Visualforce, and other advanced features of the Salesforce platform.

Salesforce Certified Platform Developer II (PDII) exam measures a candidate's knowledge and skills in advanced programmatic capabilities of the Salesforce Platform. Platform Developer II certification is designed for developers who have at least two years of experience building custom applications on the Salesforce Platform and are proficient in Apex and Visualforce. The PDII Exam covers a wide range of topics, including Apex design patterns, integration, data modeling, and testing. Successful completion of the exam demonstrates that a developer has the ability to design and implement complex business logic and interfaces using advanced programming techniques.

PDII exam preparatory: Platform Developer II & PDII exam torrent

Improvement in PDII science and technology creates unassailable power in the future construction and progress of society. As we can see, the rapid progression of the whole world is pushing people forward and the competitiveness among people who are fighting on the first line is growing intensely. PDII practice test can be your optimum selection and useful tool to deal with the urgent challenge. With over a decade's striving, our PDII Training Materials have become the most widely-lauded and much-anticipated products in industry. We will look to build up R&D capacity by modernizing innovation mechanisms and fostering a strong pool of professionals. Therefore, rest assured of full technical support from our professional elites in planning and designing PDII practice test.

Salesforce Certified Platform Developer II (PDII) is a highly respected certification that validates the skills of advanced Salesforce developers. Platform Developer II certification demonstrates a deep understanding of the advanced elements of the Salesforce platform, including Apex programming, data modeling, and integration. PDII Exam is intended for experienced Salesforce developers who are able to design and develop advanced business logic and interfaces for custom applications.

Salesforce Platform Developer II Sample Questions (Q149-Q154):

NEW QUESTION # 149

A company recently deployed a Visualforce page with a custom controller that has a data grid of information about Opportunities in the org. Users report that they receive a "Maximum view state size limit" error message under certain conditions. According to Visualforce best practice, which three actions should the developer take to reduce the view state?

- A. Refine any SOQL queries to return only data relevant to the page.2021
- B. Use the transient keyword in the Apex controller for variables that do not maintain state.
- C. Use the final keyword in the controller for variables that will not change.1617
- D. Use filters and pagination to reduce the amount of data.1819
- E. Use the private keyword in the controller for variables.1415

Answer: A,B,D

Explanation:

24

The Visualforce View State holds the state of the page (including controller variables) between server requests. It has a strict limit of 135KB. When a page handles large sets of data, like a grid of Opportunities, the view state can easily exceed this limit.

* Transient Keyword (Option A): This is the most effective programmatic way to reduce view state.

Marking a variable as transient prevents it from being serialized into the view state. This should be used for any data that is only needed for the current request and does not need to be maintained during a postback (e.g., large lists of records retrieved for a single display).

* Filters and Pagination (Option D): By using a StandardSetController or custom offset logic, the developer can limit the number of records held in memory at any given time. Instead of loading 5,000 Opportunities, the page can load and store only 20 records per page.

* Refine SOQL Queries (Option E): Developers often query "all" fields (e.g., SELECT * equivalent) or include large text areas that aren't displayed. By selecting only the specific fields required for the grid, the size of each object in the collection is reduced, directly lowering the view state.

Option B and C (private and final) affect variable visibility and immutability but do not prevent the variables from being serialized into the view state.

NEW QUESTION # 150

A Visualforce Page throws an Attempt to dereference a null object error for a Contact. What change in the controller will fix the error?

- A. Use a condition in the getter to return a new Contact if it is null.
- B. Declare a static final Contact at the top of the controller.
- C. Change the getter's signature to be static Contact.
- D. Change the setters signature to return a Contact.

Answer: A

NEW QUESTION # 151

Universal Containers needs to integrate with their own, existing, internal custom web application. The web application accepts JSON payloads, resizes product images, and sends the resized images back to Salesforce.

What should the developer use to implement this integration?

- A. An Apex trigger that calls an @future method that allows callouts
- B. A flow with an outbound message that contains a session ID
- C. A flow that calls an @future method that allows callouts
- D. A platform event that makes a callout to the web application

Answer: A

Explanation:

In a scenario where an integration requires making a callout to an external web application, Apex is often used to perform callouts. The callout must be asynchronous when being made from a trigger because a callout cannot be made from a synchronous operation like a trigger due to the possibility of long-running transactions.

Option A (An Apex trigger that calls an @future method that allows callouts) is correct because it enables the trigger to perform an asynchronous callout to the external web application, which is necessary for sending JSON payloads and receiving the resized

images.

Options B, C, and D do not fit the requirement as well as option A because platform events and flows are typically not used for making direct callouts to external systems in the context described.

Apex Developer Guide: Apex Web Services and Callouts

NEW QUESTION # 152

A developer has been asked to create code that will meet the following requirements:

Receives input of: Map<Id, Project_c>, List<Account>

Performs a potentially long-running callout to an outside web service

Provides a way to confirm that the process executed successfully

Which asynchronous feature should be used?

- A. Queueable interface
- B. Database.AllowCallouts interface
- C. Cfutur (callout=true)
- D. Schedulable interface

Answer: A

NEW QUESTION # 153

Refer to the code below:

Lightning Web Component JS file

JavaScript

```
import { LightningElement } from 'lwc';
import serverEcho from '@salesforce/apex/SimpleServerSideController.serverEcho'; export default class Helloworld extends
LightningElement { firstName = 'world'; handleClick() { serverEcho({ firstName: this.firstName
})
.then((result) => {
alert('From server: ' + result);
})
.catch((error) => {
console.error(error);
});
}
}
```

Apex Controller

Java

```
public with sharing class SimpleServerSideController {
@AuraEnabled
public static String serverEcho(sObject firstName) {
String firstNameStr = (String)firstName.get('firstName');
return ('Hello from the server, ' + firstNameStr);
}
}
```

Given the code above, which two changes need to be made in the Apex Controller for the code to work?

- A. Change the method signature to be global static, not public static.
- B. Annotate the entire class as @AuraEnabled instead of just the single method.
- C. Remove line 06 from the Apex Controller and instead use firstName in the return on line 07.
- D. Change the argument in the Apex Controller line 05 from sObject to String.

Answer: C,D

Explanation:

The current Apex controller implementation contains a type mismatch between the data being sent from the JavaScript controller and the data type expected by the Apex method. In the JavaScript file, this.firstName is initialized as the string 'world'. When the serverEcho method is invoked, it passes this string value under the key firstName.

In the Apex Controller, the parameter is incorrectly defined as an sObject. Because the JavaScript is passing a simple string, the

Apex method signature must be updated to accept a String (Option B). Consequently, line 06-which attempts to use the .get() method (a method specific to sObjects)-is no longer valid and should be removed. Instead, the developer should directly use the firstName variable in the return statement (Option C). Option A is incorrect because @AuraEnabled is a method-level annotation, not a class-level one. Option D is incorrect because public static is the sufficient and standard access modifier for Apex methods exposed to Lightning components; global is only necessary if the component resides in a different namespace (such as in a managed package). By aligning the data types between the two layers, the serialization process can correctly map the JavaScript string to the Apex string variable.
