

2V0-15.25 Test Dumps Demo & 2V0-15.25 Dumps Questions

P.S. Free 2026 VMware 2V0-15.25 dumps are available on Google Drive shared by Real4dumps: https://drive.google.com/open?id=1i1SUA1vdLBoGUqD_HbRqeOBQRDLud3pO

To make preparation easier for you, Real4dumps has created an 2V0-15.25 PDF format. This format follows the current content of the VMware 2V0-15.25 real certification exam. The 2V0-15.25 dumps PDF is suitable for all smart devices making it portable. As a result, there are no place and time limits on your ability to go through VMware 2V0-15.25 Real Exam Questions pdf.

VMware 2V0-15.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> VMware by Broadcom Solution: This section focuses on understanding VMware by Broadcom's virtualization and cloud infrastructure platform for managing modern enterprise workloads.
Topic 2	<ul style="list-style-type: none"> Install, Configure, Administrate the VMware by Broadcom Solution: This area covers installing, configuring, and managing VMware solutions including VCF Fleet deployment, expansion, and reduction operations.
Topic 3	<ul style="list-style-type: none"> Troubleshoot and Optimize the VMware by Broadcom Solution: This domain focuses on troubleshooting VCF deployment, upgrades, conversions, workload domains, fleet operations (certificates, passwords, identity), licensing, compute resources, storage (vSAN, supplemental storage), networking (VDS, NSX), VCF Operations tools, Identity Broker automation, and HCX workload migrations.
Topic 4	<ul style="list-style-type: none"> Plan and Design the VMware by Broadcom Solution: This domain addresses architectural planning and design principles for creating scalable, secure virtual environments aligned with business requirements.
Topic 5	<ul style="list-style-type: none"> IT Architectures, Technologies, Standards: This domain covers fundamental frameworks, tools, and best practices for building scalable, secure, and interoperable enterprise IT systems.

2V0-15.25 Dumps Questions | New 2V0-15.25 Test Labs

Our website is considered to be the most professional platform offering 2V0-15.25 practice guide, and gives you the best knowledge of the 2V0-15.25 study materials. Passing the exam has never been so efficient or easy when getting help from our 2V0-15.25 Preparation engine. We can claim that once you study with our 2V0-15.25 exam questions for 20 to 30 hours, then you will be able to pass the exam with confidence.

VMware Cloud Foundation 9.0 Support Sample Questions (Q41-Q46):

NEW QUESTION # 41

The administrator has to change the DRS automation level in preparation to upgrade the vCenter. When making this change through VCF Operations, the following error occurs: 'Internal Error: Failed to retrieve vim client'.

What is the possible cause of this error?

- A. DRS Automation is already set on the vSphere Client.
- B. The vCenter is overloaded with API requests from VCF Operations.
- C. Insufficient licensing for the advanced vCenter features.
- **D. Connectivity issue between vCenter and VCF Operations.**

Answer: D

Explanation:

The error:

"Internal Error: Failed to retrieve vim client"

occurs when VCF Operations cannot establish a functional API session with vCenter. The vim client is the internal vSphere API client library used by VCF Operations to perform cluster actions such as modifying DRS settings, powering on/off workloads, or retrieving inventory.

When this error appears, VMware documentation identifies these common root causes:

* Loss of connectivity between VCF Operations and vCenter

* DNS resolution issues

* Network interruption

* Stale or expired authentication tokens

* Credential mismatch If the vCenter password was changed manually, VCF Operations may be unable to authenticate.

* vCenter services restarting or unavailable If vCenter backend services (vpxd, sts, etc.) are unstable, VCF Operations cannot establish a vim session.

Option A is incorrect-DRS automation state in the vSphere Client does not cause vim client retrieval errors.

Option B (vCenter overloaded by API requests) would cause timeouts, not a vim client initialization failure.

Option D (insufficient licensing) affects feature use, not API connectivity.

NEW QUESTION # 42

An administrator logs into the VMware NSX Manage UI and observes a "Remote Logging Not Configured" alarm for each NSX Management node. What is a possible reason for this issue?

- A. Update the NSX Edge Cluster Profile to configure a remote logging server.
- B. Update the NSX Configuration Profile to configure a remote logging server.
- **C. Update the NSX Node Profile to configure a remote logging server.**
- D. Update the NSX Uplink Profile to configure a remote logging server.

Answer: C

Explanation:

The "Remote Logging Not Configured" alarm in NSX Manager is a system-health alert indicating that one or more Transport Nodes (Edges or Hypervisors) or Management Nodes do not have a Syslog server defined.

* NSX Node Profiles: In VMware NSX (and by extension VCF), the standard method to apply consistent administrative settings- such as Syslog Servers, NTP settings, and Core Dump configurations- across a fleet of nodes is to use an NSX Node Profile.

- * Configuration Path: The administrator should navigate to System > Fabric > Profiles > Node Profiles. Here, they can create or edit a profile that specifies the remote syslog server's IP/FQDN, port, and protocol.
- * Application: Once the Node Profile is applied to the NSX Management Cluster or Edge Clusters, the configuration is pushed to all respective appliances, clearing the alarm.
- * Why not A/B: Edge Cluster Profiles manage networking/BFD settings; Uplink Profiles manage NIC teaming and MTU.

NEW QUESTION # 43

An administrator is tasked to add a new host to a vSphere cluster that was created with VMware vSAN Express Storage Architecture (ESA) as its principal storage in an existing workload domain.

The administrator successfully commissions the new host with a VMware vMotion only network pool but is unable to add the host to the existing cluster.

What must the administrator do to be able to complete this task?

- **A. Change the network pool associated to the new host to the network pool for the existing vSAN ESA cluster.**
- B. Manually configure the vSAN network on the new host within vCenter.
- C. Reconfigure the currently associated network pool with a vSAN network.
- D. Decommission, reinstall ESX, and recommission the new host to the network pool for the existing vSAN ESA cluster.

Answer: A

Explanation:

In VCF 9.0, when adding a host to a vSAN ESA-enabled cluster, the host must be commissioned with a network pool that includes a vSAN network configuration. Network pools define host-level networking templates for VCF, including management, vSAN, vMotion, and overlay networks. A host commissioned with a vMotion-only network pool does not have the required vSAN ESA network interfaces (vnic + NIC mapping) to join an ESA cluster.

Because the administrator successfully commissioned the new host but only using a vMotion-only network pool, VCF correctly prevents the host from being added to the ESA cluster.

The required action is:

Reassociate the host with the correct network pool that includes the vSAN ESA network.

Option A (reinstall ESXi) is unnecessary; commissioning workflows can be redone.

Option C (manual vCenter configuration) is explicitly unsupported—VCF manages host networking.

Option D (reconfiguring the existing pool) is not correct because the new host must be associated with the same network pool used by the existing ESA cluster, not change the pool definition itself.

Therefore, the precise and VMware-documented resolution is B.

NEW QUESTION # 44

An administrator is attempting to log into the vCenter using the vSphere Client but receives an error stating "no healthy upstream." What are two possible causes for this? (Choose two.)

- **A. The SSO Service is not running.**
- B. The vmware-rbd-watchdog service is not running.
- C. The administrator logged in with the root account.
- D. Port 443 is not opened between the local machine and the vCenter.
- **E. The vpxd service is not running.**

Answer: A,E

Explanation:

The vSphere Client "no healthy upstream" error is a classic indicator that one or more vCenter backend services are not running or responding, preventing the reverse proxy layer (envoy / nginx) from routing requests to the appropriate upstream services.

Two services in particular are known root causes:

A). vpxd service not running

vpxd is the core vCenter Server service responsible for inventory, host management, and client interaction. If vpxd is stopped, crashed, or restarting, the vSphere Client cannot communicate with backend APIs, resulting in the "no healthy upstream" condition.

B). SSO (vmware-std / identity service) not running

Authentication in vCenter depends on the SSO/Identity service. If SSO is unavailable, login sessions cannot be validated, and vCenter marks the upstream service as unhealthy.

Other options do not match the behavior:

* C (Port 443 closed) would produce a connection failure, not the upstream error.

- * D (logging in with root) is fully supported and does not trigger this message.
- * E (vmware-rbd-watchdog) relates to backup/restore health, not core authentication/management planes.

NEW QUESTION # 45

An administrator is troubleshooting a vSAN issue. As part of the initial investigation, the following observations were identified:

- * vSAN cluster capacity is decreased.
- * Some virtual machine components are marked as degraded.
- * Component rebuild process started automatically.

What is the cause of this issue?

- A. VM migration to another cluster is in progress.
- B. Too many virtual machines were created in the vSAN cluster.
- C. vSAN license capacity is too small.
- **D. Physical disk failure.**

Answer: D

Explanation:

The symptoms described—reduced cluster capacity, degraded virtual machine components, and automatic component rebuild operations—are classic indicators of a vSAN disk failure or disk group degradation. vSAN continuously monitors the health of disks, disk groups, and network paths. When a physical disk or disk group becomes unavailable, vSAN will:

- * Mark affected components as degraded because the required number of replicas or witnesses cannot be maintained.
- * Trigger automatic repair/rebuild operations, provided there are enough healthy disks remaining in the cluster to satisfy the storage policy (e.g., FTT=1, RAID1/5/6).
- * Reduce available storage capacity because the failed device is removed from contributing to the vSAN datastore.

These behaviors align directly with documented vSAN failure-response logic, which states that component rebuilds begin automatically after a disk failure, assuming the cluster still has adequate resources.

The other options do not match the symptoms:

- * A. VM migration to another cluster# does not reduce vSAN capacity nor trigger component rebuilds.
 - * B. vSAN license capacity too small# restricts features, not component state or capacity changes.
 - * C. Too many VMs created# may cause capacity pressure but does not mark components degraded or trigger automated rebuilds.
- Only physical disk failure accurately explains all three observations simultaneously.

NEW QUESTION # 46

.....

While using this VMware 2V0-15.25 practice exam software, you can easily customize your VMware 2V0-15.25 mock exam conditions such as exam duration, number of questions, and many more. These VMware 2V0-15.25 bear the closest resemblance to the actual 2V0-15.25 dumps that will be asked of you in the exam.
