Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q297-Q302):

NEW QUESTION # 297

A company has an application that is hosted on Amazon EC2 instances. The application stores objects in an Amazon S3 bucket and allows users to download objects from the S3 bucket. A developer turns on S3 Block Public Access for the S3 bucket. After this change, users report errors when they attempt to download objects. The developer needs to implement a solution so that only users who are signed in to the application can access objects in the S3 bucket.

Which combination of steps will meet these requirements in the MOST secure way? (Select TWO.)

- A. Create an IAM user with an appropriate policy. Store the access key ID and secret access key on the EC2 instances
- **B. Modify the application to use the S3 GeneratePresignedUrl API call**
- C. Modify the application to delegate requests to the S3 bucket.
- **D. Create an EC2 instance profile and role with an appropriate policy. Associate the role with the EC2 instances**
- E. Modify the application to use the S3 GetObject API call and to return the object handle to the user

Answer: B,D

Explanation:

* IAM Roles for EC2 (A): The most secure way to provide AWS permissions from EC2.

* Create a role with a policy allowing s3:GetObject on the specific bucket.

* Attach the role to an instance profile and associate that profile with your instances.

* Pre-signed URLs (C): Temporary, authenticated URLs for specific S3 actions.

* Modify the app to use the AWS SDK to call GeneratePresignedUrl.

* Embed these URLs when a user is properly logged in, allowing download access.

- A. All at Once
- B. Immutable
- C. Rolling
- **D. Rolling with additional batch**

Answer: D

NEW QUESTION # 299

An organization has 10000 employees. The organization wants to give restricted AWS access to each employee. How can the organization achieve this?

- A. Create an IAM user for each employee and make them a part of the group
- **B. Use Identity federation with SSO**
- C. It is not recommended to support 10000 users with IAM
- D. Use STS and create the users' run time

Answer: B

Explanation:

Identity federation enables users from an existing directory to access resources within your AWS account, making it easier to manage your users by maintaining their identities in a single place. In this case, the

federated user is the only solution since AWS does not allow creating more than 5000 IAM users.

A website's page load times are gradually increasing as more users access the system at the same time. Analysis indicates that a user profile is being loaded from a database in all the web pages being visited by each user and this is increasing the database load and the page load latency. To address this issue the Developer decides to cache the user profile data. Which caching strategy will address this situation MOST efficiently?

- A. Create an Amazon ElastiCache cluster to cache the user profile data. Use a cache-aside caching strategy.
- B. Create a new Amazon EC2 Instance and run a NoSQL database on it. Cache the profile data within this database using the write-through caching strategy.
