

Test Docker DCA Sample Questions & DCA New Dumps Free

2026 Latest Exam4Docs DCA PDF Dumps and DCA Exam Engine Free Share: https://drive.google.com/open?id=18mPmgJBlG4ebRzQ8b-IGC4_OAA96AAWS

Customers of Exam4Docs will also receive updates for 1 year after purchase. A lot of students have prepared from the for the Docker Certified Associate (DCA) Exam (DCA) certification test and passed it in a single try. They have rated the Docker Certified Associate (DCA) Exam (DCA) as one of the best in the market to prepare for the DCA exam it in minimum time. Try a free demo now and start your journey towards your dream certification!

The Exam4Docs offers desktop Docker DCA Practice Exam software for students to practice for the DCA exam. This software mimics the actual Docker Certified Associate (DCA) Exam (DCA) exam and tracks the student's progress, records grades, and compares results. Available for Windows computers, it requires an internet connection only for license validation.

DCA New Dumps Free | New DCA Exam Cram

The format name of Docker DCA practice test questions is Docker PDF Questions file, desktop practice test software, and web-based practice test software. Choose the nay type of Docker Certified Associate (DCA) Exam DCA Practice Exam Questions that

fit your DCA exam preparation requirement and budget and start preparation without wasting further time.

Docker Certified Associate (DCA) Exam Sample Questions (Q118-Q123):

NEW QUESTION # 118

Will this command ensure that overlay traffic between service tasks is encrypted?

Solution: docker service create --network --encrypted

- A. Yes
- **B. No**

Answer: B

NEW QUESTION # 119

Are these conditions sufficient for Kubernetes to dynamically provision a persistentVolume, assuming there are no limitations on the amount and type of available external storage?

Solution: A persistentVolumeClaim is created that specifies a pre-defined provisioner.

- A. Yes
- **B. No**

Answer: B

Explanation:

Explanation

□ Kubernetes

□ A blue hexagon with a white wheel Description automatically generated

Explore

Verified Answer: B. No

The creation of a persistentVolumeClaim with a specified pre-defined provisioner is not sufficient for Kubernetes to dynamically provision a persistentVolume. There are other factors and configurations that need to be considered and set up, such as storage classes and the appropriate storage provisioner configurations. A persistentVolumeClaim is a request for storage by a user, which can be automatically bound to a suitable persistentVolume if one exists or dynamically provisioned if one does not exist¹. A provisioner is a plugin that creates volumes on demand². A pre-defined provisioner is a provisioner that is built-in or registered with Kubernetes, such as aws-ebs, gce-pd, azure-disk, etc³. However, simply specifying a pre-defined provisioner in a persistentVolumeClaim is not enough to trigger dynamic provisioning. You also need to have a storage class that defines the type of storage and the provisioner to use⁴. A storage class is a way of describing different classes or tiers of storage that are available in the cluster⁵. You can create a storage class with a pre-defined provisioner, or use a default storage class that is automatically created by the cluster⁶. You can also specify parameters for the provisioner, such as the type, size, zone, etc. of the volume to be created⁷. To use a storage class for dynamic provisioning, you need to reference it in the persistentVolumeClaim by name, or use the special value "" to use the default storage class. Therefore, to enable dynamic provisioning, you need to have both a persistentVolumeClaim that requests a storage class and a storage class that defines a provisioner. References:

* Persistent Volumes

* Dynamic Volume Provisioning

* Provisioner

* Storage Classes

* Configure a Pod to Use a PersistentVolume for Storage

* Change the default StorageClass

* Parameters

* [PersistentVolumeClaim]

I also noticed that you sent me two images along with your question. The first image shows the Kubernetes logo, which consists of seven spokes connected to a central hub, forming an almost circular shape. The logo is blue and placed on a white background. It's encapsulated within a hexagonal border. The second image shows a diagram of the relationship between persistent volumes, persistent volume claims, and pods in Kubernetes. It illustrates how a pod can use a persistent volume claim to request storage from a persistent volume, which can be either statically or dynamically provisioned. The diagram also shows how a storage class can be used to define the type and provisioner of the storage. I hope this helps you understand the concept of persistent storage in Kubernetes.

NEW QUESTION # 120

Is this a function of UCP?

Solution: image role-based access control

- A. Yes
- B. No

Answer: B

Explanation:

Image role-based access control is not a function of UCP. UCP has its own built-in authentication mechanism and integrates with LDAP services. It also has role-based access control (RBAC), so that you can control who can access and make changes to your cluster and applications¹. However, image role-based access control is a feature of Docker Trusted Registry (DTR), which integrates with UCP and allows you to manage the images you use for your applications². DTR lets you define granular permissions for images, such as who can push, pull, delete, or scan them³. References: Universal Control Plane overview), Docker Trusted Registry overview), Docker Access Control)

NEW QUESTION # 121

Will this command display a list of volumes for a specific container?

Solution: `docker volume inspect nginx`

- A. Yes
- B. No

Answer: B

Explanation:

= The command `docker volume inspect nginx` will not display a list of volumes for a specific container. This is because `docker volume inspect` expects one or more volume names as arguments, not a container name¹. To display a list of volumes for a specific container, you can use the `docker inspect` command with the `--format` option and a template that extracts the volume information from the container JSON output². For example, to display the source and destination of the volumes mounted by the container `nginx`, you can use the following command:

```
docker inspect --format='{{ range .Mounts }} {{ .Source }}: {{ .Destination }} {{ end }}' nginx
```

* `docker volume inspect` | Docker Docs

* `docker inspect` | Docker Docs

NEW QUESTION # 122

During development of an application meant to be orchestrated by Kubernetes, you want to mount the `/data` directory on your laptop into a container.

Will this strategy successfully accomplish this?

Solution. Create a Persistent VolumeClaim requesting `storageClass: ""` (which defaults to local storage) and `hostPath: /data`, and use this to populate a volume in a pod.

- A. Yes
- B. No

Answer: B

Explanation:

= This strategy will not successfully accomplish this. A PersistentVolumeClaim (PVC) is a request for storage by a user that is automatically bound to a suitable PersistentVolume (PV) by Kubernetes¹. A PV is a piece of storage in the cluster that has been provisioned by an administrator or dynamically provisioned using StorageClasses¹. A `hostPath` is a type of volume that mounts a file or directory from the host node's filesystem into a pod². It is mainly used for development and testing on a single-node cluster, and not recommended for production use².

The problem with this strategy is that it assumes that the `hostPath /data` on the node is the same as the `/data` directory on your laptop. This is not necessarily true, as the node may be a different machine than your laptop, or it may have a different filesystem layout. Also, the `hostPath` volume is not portable across nodes, so if your pod is scheduled on a different node, it will not have access to the same `/data` directory². Furthermore, the `storageClass` parameter is not applicable for `hostPath` volumes, as they are not dynamically provisioned³.

To mount the /data directory on your laptop into a container, you need to use a different type of volume that supports remote access, such as NFS, Ceph, or GlusterFS4. You also need to make sure that your laptop is accessible from the cluster network and that it has the appropriate permissions to share the /data directory. Alternatively, you can use a tool like Skaffold or Telepresence to sync your local files with your cluster56. References:

- * Volumes | Kubernetes
- * Storage Classes | Kubernetes
- * Kubernetes Storage Options | Kubernetes Academy
- * Skaffold | Easy and Repeatable Kubernetes Development
- * Telepresence: fast, local development for Kubernetes and OpenShift microservices

NEW QUESTION # 123

.....

To find better job opportunities you have to learn new and in-demand skills and upgrade your knowledge. With the Docker Certified Associate (DCA) Exam DCA Exam you can do this job nicely and quickly. To do this you just need to get registered in the Exam4Docs Docker Certified Associate (DCA) Exam exam and put all your efforts to pass this challenging Docker Certified Associate (DCA) Exam exam with good scores. However, you should keep in mind that the Docker Certified Associate (DCA) Exam exam is a valuable credential and will play an important role in your career advancement
