Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q110-Q115):

NEW QUESTION # 110

What is one primary operational challenge associated with using cloud-agnostic container strategies?

- A. Limiting deployment to a single cloud service
- B. Management plane compatibility and consistent controls
- C. Establishing identity and access management protocols
- D. Reducing the amount of cloud storage used

Answer: B

Explanation:

One of the primary operational challenges associated with using cloud-agnostic container strategies is ensuring management plane compatibility and consistent controls across multiple cloud environments. Cloud-agnostic strategies aim to make containers portable between different cloud providers. However, each cloud provider has its own management tools, APIs, and security controls, which can lead to complexities in maintaining consistent policies, monitoring, and management practices across different cloud environments.

Limiting deployment to a single cloud service is contrary to the goal of a cloud-agnostic strategy, which seeks to avoid reliance on a single cloud provider. Establishing identity and access management protocols is important but not unique to cloud-agnostic strategies; IAM challenges exist regardless of cloud approach. Reducing the amount of cloud storage used is a general optimization concern, not specifically related to cloud-agnostic containers.

NEW QUESTION # 111

Which of the following best describes the shared responsibility model in cloud security?

- A. Cloud providers handle both infrastructure and workload security.
- B. Customers handle both infrastructure and workload security.
- C. Neither cloud providers nor customers are responsible for security.
- D. Cloud providers handle physical infrastructure security while customers handle workload security.

Answer: D

Explanation:

The shared responsibility model is a key concept in cloud security. According to the CSA Security Guidance v4.0, Domain 1, Section 1.2.1, the responsibility for security is shared between the cloud provider and the customer, depending on the service model (IaaS, PaaS, SaaS).

Specifically:

"Infrastructure as a Service: Just like PaaS, the provider is responsible for foundational security, while the cloud user is responsible for everything they build on the infrastructure."

"At a high level, security responsibility maps to the degree of control any given actor has over the architecture stack." This means the cloud provider handles the physical security (data center, servers, etc.), while the customer is responsible for securing the workloads they deploy on the infrastructure, such as their applications, data, configurations, and access controls.

Incorrect Options:

B is incorrect because providers do not manage your workload or data security.

C is false - both parties share responsibilities.

D is incorrect because customers do not manage the cloud's physical infrastructure.

NEW QUESTION # 112

Which of the following is a common security issue associated with serverless computing environments?

- A. Complex deployment pipelines
- B. High operational costs
- C. Misconfigurations
- D. Limited scalability

Answer: C

Explanation:

Serverless environments are vulnerable to misconfigurations, which can expose sensitive data and resources, making security configurations critical. Reference: [Security Guidance v5, Domain 8 - Cloud Workload Security][source 16].

NEW QUESTION # 113

Which of the following authentication is most secured?

- A. Bio metric Access
- B. Active Directory
- C. Username and encrypted password
- D. Multi-factor Authentication

Answer: D

Explanation:
All privileged user accounts should use multi-factor authentication(MFA). If possible, all cloud accounts(even individual user accounts) should use MFA. It's one of the single most effective security controls to defend against a wide range of attacks. This is also true regardless of the service model: MFA is just as important for SaaS as it is for IaaS.

NEW QUESTION # 114

Which of the following is a key component that allows programmatic management of the cloud?

- A. API Gateway
- B. Control Plane
- C. APIs
- D. Firewall

Answer: C

Explanation:
Application Programming Interfaces allow for programmatic management of the cloud. They are the glue that holds the cloud's components together and enables their orchestration. Since not everyone wants to write programs to manage their cloud, web consoles provide visual interfaces. In many cases web consoles merely use the same APIs you can access directly.
